SOIL TYPES AND GROWTH OF ALGAE IN BANGOS FISHPONDS

By D. Z. Rusell, and A. S. Angüelles Of the Burray of Science, Manila

(n the Philippines the commonest edible fish is the bangos (Chanos chanos Forskål). The cultivation of this fish in ponds has been developed extensively, especially around Manila Bay.

Bañgos are essentially vegetarians. Their food consists principally of various species of algæ, known locally as lumut. When the supply of lumut is abundant the fish thrive and grow rapidly. Although hydrophytic in character these plants get part of their subsistence and anchorage from the soil.

This paper gives the results of a preliminary investigation to determine the types of soil found in some bangos ponds and to ascertain their relation to the growth of the algre.

HORIZONS OF FISHPOND SOILS

Soils that have water as the principal gross component were designated by Veatch as hydrosols. He classified such soils into four major morphologic horizons; namely, aqueous, subaqueous, and basal horizons in addition to the subbasal geologic substratum.

The hydrosols of the bangos pends around Manila Bay belong, in general, to the lacustrine group of shallow saline aqueous horizons. The depth of the aqueous horizon ranges from 20 centimeters in Cavite Province to 110 centimeters in Pampanga.

Aqueous harizon.—The first major horizon consists of the surface water, which is the "A₀" horizon of the normal soil

496

profile. Its importance lies in the fundamental requirements of many aquatic plants, which live almost entirely in a medium of water. Salinity, hardness, solids in suspension, and depth of the water are the most important factors in this zone.

Subaqueous horizon.—The second major horizon, the mudportion, is the "A" horizon in the normal soil profile. This is the anchorage place for most of the aquatic plants and a source of their nutrients. The physical properties and chemical composition of the soil in this zone naturally affect the growth of the plants.

Basal horizon.—The third major horizon is the "B" horizon in the normal soil profile. This is not as important as the subaqueous horizon. However, when the first and second horizons are shallow, its importance becomes quite significant.

Subbasal geologic substratum.—This is the "C" horizon in the normal soil profile. The character of the basal horizon is more or less dependent upon the geologic formation of this subbasal horizon.

SOIL TYPES OF SUBAQUEOUS HORIZONS

Field observations and the collection of soil samples of subaqueous horizons were made in four provinces bordering on Manila Bay; namely, Batsan, Pampanga, Rizal, and Cavite. All the samples were obtained from representative bangos ponds by means of a post-hole digger. The growth of alga, where the samples were taken, was carefully noted.

There were 6 samples collected from Bataan, 11 from Fampanga, 4 from Bulacan, 8 from Rizal, and 4 from Cavite, making a total of 33 soil samples. The number and location of the samples are recorded in Table 1. The description and relative growth of algor are given in Table 2.

Soil samples of the subaqueous horizons of the different fishpends were classified according to definite soil types as follows:

Type 1.—Peaty clay either compact or matted in structure. Samples 11, 16, 17, 18, and 25.

Type 2.—Peaty clay either soft or fluid in consistency. Sample 23.

Type 3.—Slimy clay, slightly organic and gelatinous in consistency. Samples 9, 13, 14, 19, 21, and 33.

Type 4.—Clay-colloid, largely inorganic, containing either dark-colored, grayish green, or reddish mud. Samples 10, 15, 26, 27, 36, and 40.

Type 5.—Fine sandy mud, sand-organic matter admixed. Samples 4, 6, 7, 32, 35, 38, and 42.

Type v.—Sandy mud, sand-shell admixed. Samples 1, 3, 8, 29, 30, 31, and 37.

Type 7.-Sand, clean sand compact. Sample 34.

There is a wide range of texture and consistency in the subaqueous horizons of the different fishponds around Manila Bay. Fishponds in Pampanga and Bulacan Provinces, along Pampanga and Guagua Rivers, have subaqueous horizons of fine texture consisting mostly of clay with decayed trunks, leaves, and roots of the nipa palm. This is particularly true of the ponds at the Hacienda San Esteban of the Ayala Company and the Hacienda Sapang Cauayan of the La Tondeña Company, which are in a nipa-palm region.

² Organic matter was obtained by the law on ignition.

Bataan, Rizal, and Cavite Provinces have fishponds located near the sea with subaqueous horizons of varying texture depending upon the distance of the pend from the seashere and the type of soil in the immediate vicinity.

The subaqueous horizons of fishponds in Balanga, Bataan Province, consist mostly of fine sandy mud. In Malabon and Caloocan, Rizal Province, they are composed chiefly of fine sand. In Parañaque and Las Piñas, Rizal, they are a sandy mud that is black to dark gray in color; and in Bacoor and Noveleta, Cavite, they are also sandy mud.

EXPERIMENTAL PROCEDURE

Mechanical and chemical analyses were made of the individual soil samples included in each soil type. The analytical results of the samples included in each type were then averaged in order to get the mean results for each particular type.

Average mechanical analyses of the different types of subaqueous horizons are given in Table 3, and in Table 4 are given the average chemical analyses. Included in these tables are also notes on the growth of algae corresponding to various types of subaqueous horizons.

The mechanical analyses were made in accordance with the method of Olmstead, Alexander, and Middleton. The methods of the Association of Official Agricultural Chemists were used for the chemical analyses. The elements determined were nitrogen, phosphorus, and potassium. Organic matter was ascertained by the loss on ignition.

SUMMARY

A preliminary investigation of the soils of some fishponds bordering on Manila Bay was carried out.

61. 1

Data from the mechanical and chemical analyses (Tables 3 and 4) indicate that, in general, algae seem to grow very abundantly in types of subaqueous horizons that have a high-solution loss and a high content of clay, nitrogen, and organic matter. Types that are deficient in these characteristics generally have very few algae.

DIATOMS FROM KIZAKI LAKE, HONSHU ISLAND NIPPON

By B. W. SKVORTZOW Of Harbin, Manchankuo

BIXTEEN PLATES

In presenting this list of the diatoms that I found in Kizaki Lake, Shinano Province, Honshu Island, Nippon, I wish to offer some general results of the investigation.

The diatom material was collected in July, 1927, by Mr. K. Kiuchi, and sent to me through the kindness of Prof. Dr. T. Rawamura, director of the Zoölogical Institute, College of Science, Kyoto Imperial University. The material consisted of a glass tube with mud from the lake. The crude material was first examined under the microscope, by the use of magnifying powers ranging from 100 to 600 diameters, and only a few diatoms were discovered. When the mud was prepared for accurate investigation I found thousands of siliceous alga. The material was boiled in commercial hydrochloric acid for onehalf hour. The acid when cold was decanted, and the residue washed with water to get rid of the resultant salls. After a few days the material was boiled in concentrated commerciat sulphuric acid for one-half hour, after which powdered potassium chlorate was slowly added to the boiling acid until the black color gave place to yellow. A week was spent in removing the traces of acids and salts from the material. The prepared diatoms were preserved in alcohol. The diatom material was mounted in commarone-piperin and mercuric iodide (HgI2), proposed by Dr. R. W. Kolbe. I have examined a hundred microscopic slides with apochromat 2 mm E. Leitz, Wetzlar, and compensating oculars 6, 8, and 12. Half a year was spent in the study of this collection.

The diatom flora of Kizaki Lake is rich. The slides examined yielded 338 forms, a list of which is given below. Diatoms, especially those living in fresh water, are known to be very cosmopolitan in their habitats. Nevertheless, there are certain species characteristic of alpine and Arctic regions, and others

of warm climates. The diatom flora of Kizaki Lake is largely represented by various species of *Melosira* and *Cyclotella* and, especially, naviculoid forms, which are abundant in colder waters. Northern, Arctic, and alpine species predominate; tropical elements are richly represented. The alpine and Arctic diatoms are the following:

Melosira distans.
Melosira italicu var. valido.
Cyclotella plomerata.
Diatoma hiemale.
Eunotia pracruptu.
Eucacconeis flexella.
Achaanthes lanceolata var.
elliptica.
Frastulia rhomboides.
Neidium bisulcatum.
Neidium Kozlowi.

Diploneis marginestriata.
Navioula Rolacana.
Pinnularia leptosoma.
Cymbella naviouliformis.
Cymbella aequalis.
Cymbella heterapleura var. minor.
Cymbella gracilis.
Cymbella alpina.
Gomphonema quadripunetatum.
Rhopolodia parallela.

It is interesting to note that Neidium Kozlowi is reported from central Asia and Gomphonema quadripunctatum from Baikal Lake, northern Europe, and Mongolia.

To tropical elements must be referred the following species:

Melosira americana.
Melosira undulata vax. Normanni.
Actinella brasiliensis.
Eunotia tropica.
Neidium oblique-striatum vax.
Navicula confervacca.

Amphora delphinea.
Cymbella turgidula.
Cymbella turgida.
Gomphonema gracile.
Gomphonema Berggrenii.
Epithemia cistula var. hwarie.
Surirella Terryana.

Such diatoms as Melosira americana, Neidium oblique-striatum, and Surirella Terryana occur in South America. A peculiar diatom, Actinella brasiliensis, is still living in Nippon, occurs in Demerara River in Guiana, South America, and is known as a fossil in the southern part of France. Gomphonema Berggrenit was described from New Zealand; Epithemia cistula is living in India and southern China, and is reported as a fossil in Hungary.

The brackish-water species from Kizaki waters are represented by the following:

Fragilaria construens var. subsalina. Achuanthes Hauckiana. Rhoicosphenia curvata.

Diploneis Smithii var.

Navicula protracta. Navicula holophila forma minor. Navicula salinarum var. Pinnularia viridis var. leptogongyla.

Large new forms of Diploneis Smithii found in Kizaki Lake seem to belong to alpine species. The type of Diploneis Smithii

I

J

is known from brackish waters. Two fossil diatoms were discovered in Kizaki Lake. These are Pinnularia lignitica, originally reported from Nippon lignite, and Cymbella sinuala, var. antiqua, from Hungary.

The endemic diatoms in Kizaki Lake are represented by the following species:

Ceratoneis arcus var. Hattoriana.
Syncdra japonica.
Achnanthes pinnata var. japonica.
Navicula subdicephala.
Navicula globulifera.
Pinnularia divergens var. japonica.
Pinnularia lignitica.

Pinnularia platyeephala var. Hattoriana.
Pinnularia montana var.
Cymbella japonica.
Gomphonema vastum.
Gomphonema lingulatum.
Nitzschia interrupta.
Surirella robusta forma lata.
Surirella Capronii var. obtusa.
Surirella Pantoseekii.

All these diatoms were described by Reichelt, Meister, Hustedt, and Cleve. The present list contains the names of 94 new diatoms, and they are also endemic to this country. This note is illustrated with drawings by the author, which will be of use in future investigations.

MELOSIRA VARIANS C. A. Ag. Plate 2, 6g. 23.

Melosira variana C. A. Ag., FR. Husteet, Bacillar. (1930) 85, fig. 41.

Frustules 0.015 mm in breadth. Not common in Kizaki Lake. Known from Nippon.

WELOSHRA GRANULATA (Ebr.) Raifs. Plate 1, \$2, 8.

Melosira granulata (Ehr.) Ralfs, Fr. Hustert, Bacillar. (1930) 87, fig. 44,

Frustules 0.01 mm in breadth. Rare. Known from Ackiko Lake.

MELOSTRA DISTANS (Ehr.) Kätz. Pinte 1, 2g. te.

Melosira distanz (Ehr.) Kütz., Fr. Hustept, Bacillur. (1930) 92-93, fig. 53.

Frustules 0.005 to 0.007 mm in breadth with fine puncta 15 in 0.01 mm. Common in Kizaki and Aokiko Lakes. Known from alpine waters.

MELOSIRA DISTANS (Ehc.) Bütz, var. LIRATA (Ehr.) Beihge. Plate 10, ng. 12, Melosira distans (Ehr.) Kütz, var. lirata (Ehr.) Beihge, Fr. Hustedt, Bacillar. (1930) 93, fig. 55.

A variety with more robust frustules 0,006 to 0,007 mm in breadth. Striæ 10 in 0.01 mm. Rather common in Kizaki

Lake. The variety africana O. Mull., found by Fr. Hustedt in Aokiko Lake, was not seen in Kizaki Lake.

MELOSIRA AMERICANA Kuiz. Plate J. 9g. L.

Melosira americana Këtzina, Bacillar (1865) 55, pl. 30, fig. 69; Fr. 1 Husteirt, Bacillar, a. d. Ackikosee in Japan 156, pl. 5, fig. 8.

Frustules cylindrical, barrel-shaped, 0.012 to 0.015 mm in diameter, with spinous junctions. This species is fairly abundant in Kizaki Lake, *Melosira americana* was described by Kützing from tropical America in 1865 and found by Fr. Hustedt in Aokiko Lake in Nippon.

MELOSIRA BINDERANA Kūtz. Plate 1, 6gs. 2 and 4; Piote 10, 6g. 6.

Mclosira Binderana Kütz., Fr. Hustror, Bacillar. (1930) 86-87, fig. 43.

A distinct species with small, slightly siliceous frustules. Breadth, 0.004 to 0.005 mm. Common in Kizaki Lake. Known from Europe and Asia.

MELOSIRA CHOULATA (Fig.) Ritts. var. Normanni Arnott, Plate L dg. 2.

Melosiru undulata (Ehr.) Kütz. var. Normanni Arnott, Van Hrurck,
Synopsis pl. 90, fig. 7.

A very robust species with frustules 0.027 to 0.03 mm in breadth. This tropical diatom is known from Ackiko Lake in Nippon, southern China, and Java, and is a fossil in Europe.

MELOSIRA ITALICA (Ehr.) Kötz. var. TENUISSINA (Gren.) O. Meil. Plate 1. 5c. 5.

Melosira italica (Ehr.) Kötz. var. tenuissima (Grun.) O. Meil., VAN
HEURCH, Synopsis pl. 88, fig. 11.

A delicate form with frustules 0.004 mm in breadth. Common in Kizaki Lake.

MELOSIRA ITALICA (Ehr.) Kötz. var. VALIDA Gran. Plate 1. fig. ?-

Melosira italica (Ehr.) Kütz, vor. valida (irun., Fr. Hustert, Bacillar. (1930) 94, fig. 51.

A distinct form with frustules 0.02 to 0.03 mm in breadth and 0.027 to 0.03 mm in length. Puncta 12 in 0.01 mm. Very common in Kizaki and Ackiko Lakes in Nippon. Known from subalpine regions.

MELOSIRA ITALICA (Ehr.) Kötz. sobsp. SUBARUTICA O. Mail. Plate 1, Og. 5.

Melosira italica (Ehr.) Kütz. subsp. subarctica O. Mail., Fr. Hustent,
Bacillar. (1930) 92, fig. 52.

Frustules in long filaments, 0.0076 to 0.003 mm in breadth. Strike 18 in 0.01 mm. Puneta 24 in 0.01 mm. Known from Nippon.

ı

CYCLOTELLA STELLIGERA Clove and Gross. Plate J. Sg. II.

Cyclotella stelligera Cleve and Grun., Fr. Huster, Bacillar. (1930) 100, fig. 65.

A distinct species with a ring of alveoli in the center of the valve. Diameter of the valve 0.012 mm. Striæ 13 in 0.01 mm. Not common. Known from Aokiko Lake.

CYCLOTELLA GLOMERATA Bachmann fo. NIPPONICA fo. nov. Pints 1. dg. 12.

A little species with circular valve consisting of a hyaline central area, one-half the diameter of the valve, and a rim of transverse striæ. Diameter of the valve, 0.0036 to 0.004 mm. Striæ 18 in 0.01 mm. Differs from the type in its coarser striæ. Cyclotelia glomerata is known from subarctic lakes of Europe.

CYCLOTEDILA MENEGHINIANA KUIS, var. NIPPONICA var. nov. Pisto 3, fig. 14.

This new variety differs from the type by a ring of scattered beads near the marginal rim of the transverse striæ. Diameter of the valve, 0.012 mm. Striæ robust, 7 in 0.01 mm. Occasional in Kizaki Lake.

CYCLOTELLA COMTA (Ehr.) Röte.

Cuclotella comta (Ehr.) Kütz., Van Herrok, Synopsis pl. 92, figs. 16-23.

Valve circular; consisting of a large central area, two-thirds the diameter of the valve and a rim one-third the valve diameter; the former with puncta finely distributed over the entire valve in rows radial from the center. Rim ornamented with delicate transverse strize. Diameter of the valve, 0.001 to 0.045 mm. Very common in Kizaki Lake. Known from Aokiko Lake.

CVCLOTELLA COMTA (Ebe.) Kütz. var. PAUCIPUNCTATA Grun. Plate 12, fig. 2.

Cyclotella comta (Ehr.) Kütz. var. paucipunctata Grun.. Van Heurek,

Synopsis pl. 93, fig. 20.

A variety with a small central area, with scattered beads forming a star in the center. Diameter of the valve, 0.012 mm. Strike 18 in 0.01 mm. Very rare. Known from Ackiko Lake in Nippon.

CYCLOTELLA COMTA (Ebr.) Kútz. fo. PARVA fo. nor. Pfate 8, 82, 13.

Differs from the type in its smaller valve. Diameter of the valve, 0.0042 to 0.006 mm. Common in Kizaki Lake.

STEPHANODISCUS ASTRAEA (1964.) Gron.

Stephanodiseus ustroen (Ehr.) Grun., VAN HEURCE, Synnysis (1880-1981) pl. 95, figs. 5, 6.

A common diatom in Kizaki Lake. Known from Aokiko Lake.

TABELLARIA FLOCCULOSA (Roth.) Buts. Plate 1, Sg. 16.

Tabellaria flacculosa (Roth.) Kütz., Fr. Hustmir, Bacillar. (1930) 123-124, fig. 101.

Valve linear with median inflation larger than the terminal... Common in Kizaki Lake.

TABELLARIA PENESTRATA (Lyngh.) Kütz. Piete i, fig. 35.

Tabelluria fenestrata (Lyngb.) Kütz., Fr. Hustent, Bacillar. (1930) 122-123, fig. 99.

Valve linear, gibbous in the middle. Ends capitate. Length, 0.068 mm; breadth, 0.0045. Striæ 18 in 0.01 mm. Uncommon in Kizaki Lake.

DIATOMA VULGARE Hosy var. LINEARIS Gren. Plate 10, 6g. 7.

Diatoma vulgare Bory var. linearis Grun., A. Schmidt, Atlas Diatom. pl. 265, figs. 11-17.

Valve linear with slightly truncate end. Length, 0.024 mm; breadth, 0.0034. Strize 15 in 0.01 mm. Not common.

DIATOMA HIEMALE (Lyngh.) Reiberg. Plate 1, 6g. 24; Plate 2, 6g. 34; Plate 10, 6g. 12.

Diatoma kiemale (Lyngh.) Heiberg, Fr., Hustror, Bacillar. (1930)
129, fig. 115.

Valve lanceolate, obtuse. Length, 0.02 to 0.03 mm; breadth, 0.006 to 0.005. An alpine species.

DIATOMA HIEMALE (Lyngh.) Holders var. MESODON (Ebc.) Grup. Plate 1, 52, 13; Plate 2, 5g. 18; Plate 10, 5g. 75.

Distance hierale (Lyngh.) Heiberg var. mesodon (Ehr.) Grun., Fra. Husteur, Hacillar. (1930) 129, fig. 116.

Valve broad elliptic. Length, 0.012 to 0.017 mm; breadth, 0.007. An alpine diatom reported from Aokiko Lake.

MERIDION CIRCULARE Agardh. Plate 1, 5g. 19.

Meridion circulare Agardh, FR. HUSTEDT, Bacillar, (1930) 130-131, fig. 118.

Valve clavate. Length, 0.032 mm; breadth, 0.0045. Costæ 4 in 0.01 mm. Not common. Known from springs and mountain streams.

MERIDION CIRCULARE Agardh var. CONSTRICTA (Ruifs) Von Beurch. Plate 16, 6g. 28.

Meridion circulare Agardh var. constricta (Ralfs) Van Heurek, Fa. Hustent, Bacillar. (1930) 131, fig. 119.

Valve clavate with constricted capitate ends. Length, 0.03 mm; breadth, 0.004. Not common.

OPEPHORA MARTY! Heritoned. Plate 2, fig. 27; Plate 13, fig. 3.

Openhora Mariyi Heriband, Fr. Hustrar, Bucillar. (1930) 132-135, fig. 120.

Valve broad-ovate, or elongate, rounded at one end and acute at the other. Length, 0.0076 to 0.012 mm; breadth, 0.0025 to 0.003. Costæ 12 in 0.01 mm. Common in Kizaki Lake. Known from Aokiko Lake.

Valve robust; convex, attenuate towards the ends. Ends broad-obtuse. Length, 0.023 to 0.042 mm; breadth, 0.0068 to 0.009. Costa 5 to 6 in 0.01 mm. Common.

OPEPHORA MARTYI Resiband var. ELONGATA var. nov. Plate 13, fig. 12,

Valve long-ovate. One end much broader than the other.

• Length, 0.015 mm; breadth, 0.005. Costæ 9 in 0.01 mm. A distinct variety.

OPEPHONA ORADE sp. tiny, Plate 12, 6g. 4.

Valve elaviform with subtruncate and usually constricted apex. End attenuate, constricted and capitate. Central area linear. Length, 0.024 to 0.03 mm; breadth, 0.0042 to 0.005. Costre 7 in 0.01 mm. A species distinct from O. Martyi Heribaud. Named in honor of Dr. Yoshikazo Okada, of Tokyo.

CERATONEIS ARCUS KIRE, var. HATTORIANA Meister. Plate 1, fig. 38.

Ceratoneis areus Kütz, var. Hattoriana Metsren, Beiträge zur Bacillar. Japan 2 (1914) 226-227, pl. 8, figs. 1-3.

Valve linear with rostrate ends. Length, 0.061 mm; breadth, 0.005. Strike 12 in 0.01 mm. Not common in Kizaki Lake. Reported from Yokohama.

CERATONEIS ARCUS Ratz, var. AMPHIONYS (Rable). Plate 2, fig. 35: Plate 3, figs. 13 and 46.

Ceratoneis areas Kutz. var. amphioxys (Rabb.), Fn. Hestert, Bacillar. (1930) 135, fig. 123.

Valve lanceolate with asymmetrical sides. Length, 0.017 to 0.032 mm; breadth, 0.0045 to 0.006. Striæ 15 to 18 in 0.01 mm. Common in Kizaki Lake.

PRAGILABIA HARRISSONII W. Smith. Plate 16, fig. 4.

Frayilaria Harrissonii W. Smith, Fr. Mestent, Bacillac. (1930) 139-140, fig. 132.

Valve broad, cross-shaped with rounded ends. Length, 0.014 mm; breadth, 0.008. Pseudoraphe narrow. Costæ very distinct. A fresh-water diatom.

FRACILARIA HARRISSONII W. Smith vac. RHOMROIDES Grow. Plate 14, 63. C. Fragilaria Harrissonii W. Smith var. rhomboides Grow., Fr. Hustedt, Bacillat. (1930) 140, fig. 133.

Valve broad-lanceolate. Length, 0.01 mm, breadth, 0.005. Costæ robust, 9 in 0.01 mm.

FRAGILARIA HARRISSONII W. Smith var. DUBIA Cross. Plate 16, 5g. 6.

Fragilaria Harrissonii W. Smith var. dubia Grun., FR. Husteof, Bacillar, (1930) 140, 6g. 134.

Valve lanceolate with attenuate and capitate ends. Length, 0.0187 mm; breadth, 0.005. Costæ robust, 9 in 0.01 mm. Not common. Known in European lakes.

PRAGILARIA PINNATA Ehr. Plate 1, 6g. 9; Plate 17, 6g. 21.

Fragilaria pinnata Ehr., FR. Hustest, Bacillar. (1930) 142, fig. 141b.

Valve clliptical, with broad ends. Length, 0.0034 to 0.006 mm; breadth, 0.0027 to 0.0034. Costæ 12 in 0.01 mm. A freshwater diatom. In Kizaki Lake variety lancettula is reported.

FRAGILARIA CROTONENSIS Kitton. Plate 1, 6g. 26.

Fragilaria erotonomeis Kitton, FR. Hustedt, Baeillar. (1930) 137-138, fig. 125.

Valve linear-lanceolate with long-acuminate ends. Length, 0.12 to 0.015 mm; breadth, 0.003. Striæ 12 to 13 in 0.01 mm. Common in fresh water. Known from Aokiko Lake.

FRAGILARIA GRACILLIMA Mayer. Plate 1, 6g. 23.

Frayilaria gracillima Mayer, Fr. Hustert, Bacillac. (1930) 139, fig. 121.

Valve long-lanceolate with capitate and constricted ends. Pseudoraphe very narrow, indistinct. Length, 0.018 mm; breadth, 0.002. Strize very fine, 24 in 0.01 mm. This species is reported from Germany only.

FRAGILARIA CAPUCINA Desm. Plate 1, 65. 21.

Fragilaria capucina Desm., Fn. Hustept, Bacillar. (1930) 138, fig. 126.

Valve sublinear with slightly rostrate and obtuse ends. Length, 0.04 mm; breadth, 0.004. Striæ 12 in 0.01 mm. Pseudoraphe very narrow. In the middle part of the valve the striæ are interrupted, forming a quadrate central area. A plankton species, known also from Aokiko Lake in Nippon.

PRAGILARIA VIRESCENS Balfo. Plate 9, 64, 15.

Fragilaria virescens Ralfs, FR. HUSTEDT, Bacillar, (1930) 142, fig. 144.

Valve lanceolate, rostrate and obtuse. Length, 0.017 mm; breadth, 0.005. Strice 18 in 0.01 mm. Pseudoraphe very

narrow and linear. Very common in Kizaki Lake. Known from many parts of the world.

PRAGILARIA VIRESCENS Raifs var. ELLIPTICA Hastedt (n. NIPPONICA fo. nov. Flate 12, 22, 20.

Valve lanceolate, dilated, obtuse, not rostrate. Length, 0.009 mm; breadth, 0.003. Strice 18 in 0.01 mm. This form differs from variety elliptica in having narrower valves.

FRAGILARIA DREVISTRIATA Gros. Plate 14. dg. s.

Fragilaria brevistriata Grun., Fe. Hustent, Bacillar. (1930) 146, fig. 151.

Valve lanceolate with acute ends. Length, 0.015 mm; breadth, 0.0034. Striæ 18 in 0.01 mm, marginal. Common.

FRAGILARIA BREVISTRIATA Grun. var. INFLATA (Pant.) Hustedt fo. CURTA fo. nov. Plate 1, Sg. 18.

Valve short, lanceolate, with attenuate, obtuse ends. Length, 0.0085 mm; breadth, 0.0084. Striæ 15 in 0.01 mm. The typical variety inflata has a more clongate valve.

PRAGILARIA DERVISTRIATA Gron, var. NIPPONICA var. nov. Plate 15, Sg. 7.

Valve lanceolate, biconstricted, with rostrate ends. Length, 0.02 mm; breadth, 0.005. Strike 15 to 17 in 0.01 mm. This diatom resembles, under a low power, Fragilaria Magocsyi Lacsny known from Hungary, from which, however, it is different.

FRACHLARIA CONSTRUENS (Dhr.) Gros. Plate 1, Ggs. 25 and 28,

Fragilaria construens (Ehr.) Grun., A. Schmidt, Atlas Diatom., pl. 296, figs. 40-47.

Valve broad-lanceolate with rostrate ends. Length, 0.008 to 0.01 mm; breadth, 0.004 to 0.006. Striæ 15 to 18 in 0.01 mm. This diatom is widely distributed in fresh waters.

PRAGILARIA CONSTRUENS (Fire.) Grun, var. SUBSALINA Bestedt. Plate 11. hg. 19.

Fragilaria constructs (Ehr.) Grun. var. subsalina Hustent, Racillar. (1930) 141, fig. 132.

Valve linear-lanceolate with obtuse ends. Length, 0.012 mm; breadth, 0.0032. Strike 15 in 0.01 mm. This variety differs from the type in its narrower valves. It is known from brackish waters of Europe.

400-----

FRAGILARIA CONSTRUENS (Ehr.) Grun, var. TRIUNDULATA Reichelt. Plate 19, 5g. 32.

Fragilaria construens (Ehr.) Grun, var. triundulata Reichelt, Fr., Husten, Bacillar. (1930) 140, fig. 136.

Valve lanceolate, triundulate with rostrate ends. Length, 0.02 mm; breadth, 0.005. Striæ 18 in 0.01 mm. Pseudoraphe linear. Not common in Kizaki Lake.

FRAGILARIA CONSTRUENS (Ehr.) Grun. var. BINODIS (Ehr.) Grun. Plate 1, 62, 17; Plate 16, 62, 9.

Fragilaria construens (Ehr.) Grun, var. binodis (Ehr.) Grun, Fr. Hustept, Bacillar. (1936) 140-141, fig. 137.

Valve biconstricted. Length, 0.017 to 0.02 mm; breadth, 0.005 to 0.006. Strixe 15 in 0.01 mm. Variety binodis is reported from Aokiko Lake.

FRAGILARIA CONSTRUENS (Ehr.) Grun, var. NiPFONICA var. nov. Plate 10, 5g. 13; Plate 16, 6c. 13.

Valve minute, broad-lanceolate with vostrate ends; constricted from one or from both sides. Length, 0.009 to 0.011 mm; breadth, 0.005. Striæ 15 in 0.01 mm. This differs from variety binodis in its shorter valves.

ASTERIONELLA GRACILLIMA (Hantesch) Heiberg, Plate 1, figs, 33 and 34.

Asterionella gracillima (Hantzsch) Heiberg, Fr. Hostedt, Bacillar. (1930) 147, fig. 157.

Valve linear with capitate ends. Length, 0.072 to 0.08 mm; breadth, 0.002. Abundant in Kizaki Lake.

SYNEDRA NANA Meister var. NIPPONICA var. nov. Flate 10, fig. 29.

Valve sublinear, attenuate towards the ends. Length, 0.026 to 0.049 mm; breadth, 0.0017 to 0.002. Striæ marginal, very fine, about 30 to 35 in 0.01 mm. Differs from the type in its slightly convex margins.

SYNEDICA CLNA (Nitrock) Ehr. Plate 1, 6g. 36; Plate 3, 6g. 5.

Synchon Ulin (Nitzsch) Ehr., Fr. Hustent, Bacillar. (1930) 151, fg. 159.

Valve linear-lanceolate with broad ends. Length, 0.136 to 0.221 mm; breadth, 0.006 to 0.008. Striæ 9 to 10 in 0.01 mm. Common in fresh water.

SYNEDRA ULNA (Nilysch) Ehr. var. RAMESI (Herib, and Perag.) Hustedl. Finite 1, fig. 37.

Synedra Ulna (Nitzsch) Ehr. var. Ramesi (Herib. and Persg.) Hostedt, Fc. Hustent, Bacillar. (1930) 152, fig. 163.

١

Valve linear-lanceolate, little constricted and with truncate ends. Length, 0.054 mm; breadth, 0.006. Strike 11 to 12 in 0.01 mm. Uncommon.

SYNEDRA ULNA (Nitzsch) Ebr. var. BICEPS (Kütz.) Piete 1, fig. 29.

Synedra Ulna (Nitzsch) Ehr. var. biceps (Kütz.), Fr. Hustent, Ba-cillar. (1930) 154, fig. 166.

Valve long, linear with capitate ends. Length, 0.2 to 0.25 mm; breadth, 0.0045. Striæ 8.5 in 0.01 mm. Common in Kizaki Lake.

SYNEDRA ULNA (Nittach) Ehr, vac. DANICA (Kütz.) Grun. Piste 10, flg. 10.

Synedra Ulna (Nitzsch) Ehr. var. danica (Kütz.) Grun., Fr. Hustept, Bacillar. (1920) 154, fig. 168.

Valve lanceolate, attenuated towards the ends. Ends slightly subtruncate and constricted. Length, 0.17 mm; breadth, 0.005. Striæ 9 in 0.01 mm.

SYNEDRA COULARDI (Breb.) Gron. Plate 10, 6g. 22.

Spinedra Goulardi (Brela) Grun., A. Schmitt, Atlas Diatom. pt. 300, figs. 10-18.

Valve deeply constricted with fruncate-rostrate ends. Length, 0.039 mm; breadth, 0.0065. Striæ 15 in 0.01 mm. Known from Demerara River, Paraguay, and from Victoria Lake, Africa.

SYNEDRA RUMPENS Kütz, var. MENEGHINIANA Grap. Plate 2, fig. 22,

Synodra rumpens Kütz, var. Meneghiniana Grun., Fr. Hostedt, Bacillar. (1930) 156, fig. 178.

Valve lanceolate with truncate ends. Length, 0.03 mm; breadth, 0.035. Strike 12 in 0.01 mm. Not common.

SYNEORA RUMPENS Kütz, var. NEPPONICA var. nov. Plate 1, Sr. 20.

Vaive sublinear, narrowly attenuated towards the ends. Strix very fine, 30 in 0.01 mm, interrupted in the middle part, forming a rectangular area. Length, 0.03 mm; breadth, 0.003. Differs from the type in its fine strix.

SYNEDRA CYCLOPUM Brutachi var. NIPPONICA var. nov. Plote 13, fiz. 21.

Valve linear-lanceolate, sigmoid, attenuate towards the ends. Length, 0.018 mm; breadth, 0.002. Striæ 18 in 0.01 mm. The typical forms of Synodra cyclopum have the valves larger and they are curved to one side. Synedra cyclopum is reported from Europe.

SYNEDRA JAPONICA Meister. Plate 1, 6g. 27; Plate 10, 6g. 9.

Synedra japonica Meister, Beiträge zur Bacillar, Japans (1913) 307, figs. 5-6.

Valve linear-lanceolate with long capitate horns, Length, 0.144 to 0.187 mm; breadth, 0.0028 to 0.003. Striæ II to I3 in 0.01 mm, interrupted in the middle and forming a quadrate area. Pseudoraphe very narrow. Common in Kizaki Lake. Known from Suwa Lake, Nippon.

SYNEDRA VAUCHERIAS REIZ. Plate 1, fig. 14.

Syncdra Vaucheriz Kütz., Fr. Hostedt, Bacillar. (1930) 161, fig. 192.

Valve lanccolate, broad and obtuse. Length, 0.012 mm; breadth, 0.0025. Strize 16 in 0.01 mm. Common in Kizaki Lake.

SYNEDRA VAUCHERIJE Kütz. var. CAPITELLATA Grun. Plate 1, 8g. 15; Plate 2, 8g. 26,

Syncdra Vuncherie Kütz, var. capitellata Grun., Fr. Hustent, Bacillar. (1930) 161, fig. 194.

Valve lanceolate, attenuate towards the ends. Ends capitate. Length, 0.018 to 0.023 mm; breadth, 0.0028 to 0.0042. Strix 12 to 16 in 0.01 mm.

SYNEDRA VAUCHERI/E Rhits, var. SIGMOIDEA var. nov. Plate 1, dg. 43.

Valve lanceolate, sigmoid, with capitate ends, turned opposite. Length, 0.02 mm; breadth, 0.004. Strike fine, 18 in 0.01 mm. Not common in Kizaki Lake.

SYNEDRA PARASITICA (W. Smith). Plate 1, 6g. 22.

Fragilaria parasitica W. Smith, A. Schmot, Atlas Diatom. pl. 296, figs. 76-80.

Valve lanceolate, convex, with produced ends. Pseudoraphe wide. Length, 0.012 to 0.02 mm; breadth, 0.004 to 0.005. Strim 18 in 0.01 mm. Meister described Fragilaria parasitica var. asterionellodes from Nippon, a variety forming asterionelloid colonies.

SYNEDRA MIPPONICA sp. nov. Plate 1, fig. 43.

Valve minute, lanceolate, attenuate towards the ends. Pseudoraphe very narrow. Length, 0.01 mm; breadth, 0.002. Strix 18 in 0.01 mm. A species related to Synedra parasitica.

ACTINELLA BRASILIENSIS Grun. Plate 8, 6g. 11.

Actinella brasiliensis Grun., A. Schmur, Atlas Diatom, pl. 292, figs. 10-19.

Valve linear, inflated at one end, capitate and apiculate. Length, 0.088 mm; breadth, 0.013. Striæ 10 in 0.01 mm. Not common in Kizaki Lake. Reported from Brazil, Chosen, and Hanka Lake in Siberia, and as a fossil in southern Europe.

EUNOTIA SEPTENTRIONALIS Oestrap. Plate 12, fig. 23.

Eunotia septentrianalis Oestrup, Fr. Hustert, Bacillar. (1930) 179, 6g. 232.

Valve lanceolate with gibbous dorsal and parallel ventral sides. Length, 0.0136 mm; breadth, 0.0034. Striæ 18 in 0.01 mm. Not common in Kizaki Lake. Reported from Germany as a relict.

EUNOTIA TROPICA Busiest, Plate 8, Age, 10 and 16.

Eurotia tropica Husrent, Bacillar n. d. Ackikosce in Japan 159, pl. 5, fig. 1.

Valve robust with four or five undulations on the dorsal side. Length, 0.078 to 0.088 mm; breadth, 0.017. Striæ 8 to 9 in 0.01 mm. Uncommon in Kizaki Lake. Known from Aokiko Lake, from Foochow, southern China, and, according to Fr. Hustedt, from the Tropics.

EUNOTIA FABA (Ehe.) Grun. var. NIPPONICA var. nov. Plate 14. ag. 4.

Valve linear and obtuse. Length, 0.013 to 0.016 mm; breadth, 0.0028 to 0.003. Strike fine, 18 in 0.01 mm. Typical Eunotia faba has larger valves, and is an alpine plant.

EUNOTIA PALUBOSA Grun, Plate 1, 6g. 25.

Eunotia paludosa Grun., Fn. Hustent, Bacillar. (1930) 178, fig. 228.

Valve linear, curved, with rostrate-truncate ends. Length, 0.047 mm; breadth, 0.005. Striæ 12 in 0.01 mm. Reported from Europe.

EUNOTIA LUNARIS (Ehr.) Gron. Plate 1. fig. 44.

Eunotia lunaria (Ehr.) Grun., Fa. Hostept, Bacillar. (1930) 183, fig. 249.

Valve linear, curved. Length, 0.085 mm; breadth, 0.0025. Striæ 18 in 0.01 mm. Uncommon in Kizaki Lake.

EUNOTIA GRACILIS (Ehr.) Rabb. Plate 1, fg. to.

Eunotia gracitis (Ehr.) Rabh., Fr. Hustept, Bacillar. (1930) 185, fig. 253.

Valve long, curved, with capitate ends. Length, 0.111 mm; breadth, 0.005. Strice 12 in 0.01 mm. Occasional in Kizaki Lake.

EUNOTIA VALIDA Bustedt. Plate 1, fig. 41.

Eunotia volida Hustrert, Bacillar. (1930) 178, fig. 229,

Valve linear, robust, with obtuse ends. Length, 0.096 mm; breadth, 0.0042. Striæ 12 in 0.01 mm. Reported from wet rocks from Europe.

EUNOTIA VENERIS (Kütz.) O. Mull. var. NIPPONICA var. nov. Plate 1, fig. 21.

Valve lanceolate-attenuate towards the ends. Length, 0.0187 mm; breadth, 0.0084. Striæ 15 in 0.01 mm. Differs from the type in having broader ends.

EUNOTIA PRÆRUPTA Ehr. Plate 12, åg. 25.

Eunotia pracrupta Ehr., Fr. Hosteot, Bacillar. (1930) 174, fig. 211.

Valve robust, curved, with convex dorsal sides. Length, 0.051 mm; breadth, 0.01. Strize 12 to 15 in 0.01 mm. An alpine diatom.

EUNOTIA PEUTINALIS (Kūta.) Rabb. var. MINOR (Kūta.) Rabb. Piete 1, fig. 30,

Eunotia pectinalis (Kütz.) Rubh. var. minor (Kütz.) Rubh., Fr. Hustert, Bacillar. (1930) 182, fig. 238.

Valve linear, curvate, slightly attenuate and obtuse. Length, 0.03 mm; breadth, 0.006. Striæ 10 to 11 in 0.01 mm. Common in fresh water.

EUNOTIA PECTINALIS (Kütz.) Rabb. var. MINOR (Kütz.) Babb. fo. IMPRESSA (Ebp.). Plate 14. Sg. 10.

Eanotia pectinulis (Kütz.) Rubh. vnc. minor (Kütz.) Rubh. fo. impressa (Ehr.), Fr. HUSTEUT, Bacillar. (1930) 182, fig. 239.

Valve lanceolate, curvate, constricted on the dorsal side. Length, 0.022 mm; breadth, 0.004. Strise 15 in 0.01 mm. Common in marsh water.

EUNOTIA PECTINALIS (Kūtz.) Rabb. var. NIPPONICA var. nov. Plate 1, fig. 32.

Valve lanceolate, attenuate towards the ends, obtuse. Two interruptions in the middle of the ventral side. Length, 0.019 nm; breadth, 0.0048. Strize 15 in 0.01 mm. Differs from the type by its interruptions.

COCCONEIS PLACENTULA (Ehr.) var. LINEATA (Ehr.) Cleve. Pinte 2, fig. 5.

Cocconeis placentala (Ehr.) var. lineata (Ehr.) Cleve, Fr. Hustert, Bacillar. (1930) 190, fig. 262.

Valve elliptical with broad ends. Length, 0.022 mm; breadth, 0.012. Striæ 18 to 20 in 0.01 mm. Common in fresh water.

COCCONEIS PLACENTULA (Ehr.) var. KISNORAPHIS Geitler fo. NIPPONICA fo. nov. Pinte 2. fig. 8.

Valve elliptical with a curvate median line. Length, 0.039 mm; breadth, 0.018. Striæ 24 in 0.01 mm. Differs from variety klinoraphis in its broad rounded ends.

COCCONEIS DIMINUTA Pant.? Plate 2, Sec. 16 to 18.

Cocconcis diminuta Pant.?, Fr. Hustedt, Bacillar. (1920) 190, fig. 265.

Valve broadly elliptical. Length, 0.008 to 0.018 mm; breadth, 0.005 to 0.01. Upper valve with linear axial area. Striæ 22 in 0.01 mm. Lower valve with lanceolate axial area with coarse elongate puncta, 12 in 0.01 mm. Common. Known from Nippon.

EUCOCCONEIS FLEXELLA (Nütz.) Plate 2, 6g. 59.

Eucocconcis florella (Kütz.), Fr. Husterr, Bacillar. (1930) 193, fig. 270.

Valve elliptical with an arcuate median line. Length, 0.035 mm; breadth, 0.015. Common in alpine waters.

ACHNANTHES MICROCEPHALA Rule. Plate 2, Bg. 22.

Achnanthes microcephala (Kütz.) Fr. Hustedt, Bacillar. (1900) 108, fig. 273.

Valve linear with subcapitate ends. Length, 0.018 mm; breadth, 0.0025. Striæ indistinct. Known from fresh water in Europe.

ACRNANTHES KIZANI sp. nov. Plate 2, 62, 25,

Valve linear, enlarged in the middle, with broad, capitate ends. Length, 0.013 mm; breadth, 0.002. Upper valve with a narrow, linear axial area and a narrow, rectangular, central area. Lower valve with slightly dilated central area. Striæ very fine, about 40 in 0.01 mm. A species related to A. microcephala Kütz.

ACHNANTHES HAUCKIANA Grun. Plate 12, 6c. 24.

Achnanthes Hanchiana Grun., Fr. Husterr, Bacillar. (1980) 202, fg. 296.

Valve elliptical, obtuse. Length, 0.015 mm; breadth, 0.005. Upper valve with a linear axial area. Strize 14 in 0.01 mm. Lower valve with a broad central area. Strize radiate. Known from hot springs and brackish water.

ACHRANTHES HAUCKIANA Gram, vor. ELLIPTICA Schule, fo. NIPPONICA fo. nov. Plate 14, fg. 6.

Valve elliptical. Length, 0.01 mm; breadth, 0.042. Upper valve with linear axial area. Striæ 18 in 0.01 mm, radiate. Lower valve with a broad central area. Differs from variety elliptica in its coarser striæ.

ACHNANTHES OESTRUPH (A. Cleve) Hustedt, Plate 2, figs. 31 and 32; Plate 12, fig. 17.

Achnanthes Ocstrupii (A. Cleve) Hustedt, Bacillar. (1930) 257, fig. 301.

Valve broad-elliptical. Length, 0.09 to 0.015 mm; breadth, 0.007 to 0.0085. Upper valve with a linear axial area, on one side of which in the middle of the valve there is a horseshoe-shaped area. Strike robust, radiate, 12 to 18 in 0.01 mm. Lower valve with a narrow statures. Strike very fine, about 35 in 0.01 mm. Known from Europe.

ACHNANTHES CLEVEL Grun, vay, NIPPONICA var. nov. Fiste 2, fig. 21.

Valve lanceolate, convex, acute, obtuse. Length, 0.014 mm; breadth, 0.005. Upper valve with narrow, linear, axial area. Strize distinctly punctate, 12 in 0.01 mm, radiate. Puncta 15 in 0.01 mm. Lower valve with narrow central area. Strize very fine, 20 to 22 in 0.01 mm. Differs from the type in its obtuse ends and differs from variety rostrata Hustedt in its broad end. Achnanthes Clevei is known from Europe.

ACHNANTRES EXIGOA Gent. Plate 7. hg. 16.

Achnanthes exigua Grun., Fn. Hustert, Bacillar. (1930) 201-202, fig. 286.

Valve elliptic with rostrate ends. Length, 0.015 mm; breadth, 0.006. Strike 24 in 0.01 mm. Known from fresh water and hot springs. Reported from Aokiko Lake.

ACUNANTHES EXIGUA Gron. var. INDICA Shvortzow. Plate 2, Ag. 38,

Achnanthes exigua Grun. var. indica SKVORTZOW, Diatoms from Calculta (1935) pl. 1, fig. 3.

Valve minute, broad-ovate. Length, 0.0068 mm; breadth, 0.0042. Upper valve with narrow axial area. Striæ parallel, 18 to 20 in 0.01 mm. Lower valve with narrow axial area, and with central area forming a short stauros with one median shortened stria opposite the stauros. Recently described by me from Calcutta, India.

ACHNANTHES EXIGUA Grun, vor. NIPPONICA var. nov. Plate 7, Gas. 7 and 8.

Valve elliptical with rostrate ends. Length, 0.012 mm; breadth, 0.0062. Upper valve with a narrow axial area. Striæ

18 in 0.01 mm, parallel, at the ends slightly radiate. Lower valve with a median stria, opposite to the fascia being shortened. The type of Achnanthes exigua Gran. differs from variety nipponica in its bilateral broad fascia.

ACRNANTHES PERAGALLIS Bron and Hersboad. Plats 2, Sg. 30.

Actinanthes Peragalli Brun and Herisaup, Diatom. d'Auvergne (1893) 50, pl. 1, fig. 4.

Valve broadly elliptical with apiculate ends. Length, 0.012 mm; breadth, 0.006. Upper valve with lanceolate axial area, on one side of which there is a horseshoe area. Striæ 18 in 0.01 mm. Lower valve with dilated central area. Known from Aokiko Lake.

ACHNANTHES PERAGALLII Uron and Reiribaud var. NIPPONICA var. nov. Plate 2. Ag. 10.

Valve lanceolate, convex, with long-attenuate ends. Length, 0.025 mm; breadth, 0.0085. Upper valve with a broad, axial area. Central area of the lower valve with a broad stauros. Differs from the type in its more elongate shape. Common in Kizaki Lake.

ACHNANTBES GRACILLIMA Hustedt var. NJPPONICA var. nov. Plate 4, figs. 3 and 42 Plate 4, fig. 9.

Valve slightly siliceous, narrow-lanccolate with attenuate and capitate ends. Length, 0.015 to 0.018 mm; breadth, 0.0034 to 0.0036. Upper valve with indistinct axial area. Lower valve with a narrow axial area outwardly dilated. Striæ very fine, indistinct. Common in Kizaki Lake. The type is reported from Aokiko Lake.

ACHNANTHES APPINES Gree, var. MINUTA var. nov. Plate 10, 8g. 27,

Valve linear-lanceolate with obtuse ends. Length, 0.0085 mm; breadth, 0.0017. Upper valve with a narrow axial area. Striæ radiate, very fine, in the middle 30, at the ends 40, in 0.01 mm. Lower valve with a dilated central area. The type of Achnauthes affinis occurs in fresh waters of Europe, Tasmania, and North America.

ACHNANTHES MINUTISSIMA Kats. Plate 2, figs. 15 and 23,

Achnanthes minutissima Kütz., Fr. Mustrov, Bacillar. (1980) 198, 6g. 274.

Valve linear with attenuate and obtuse ends. Length, 0.013 to 0.022 mm; breadth, 0.002 to 0.005. Striæ 28 in 0.01 mm or very fine and indistinct. Not common.

ACHNANTHES MINUTISSIMA Kötz, var. CRYPTOCEPRALA Gran. .Plate 2, fg. 21,
Achaanthes minutissima Kütz, var. cryptocephala Grun., Fr. Hustedt,
Bacillay. (1930) 198, fig. 275.

Valve linear with capitate ends. Length, 0.015 mm; breadth, 0.002. Strike 30 in 0.01 mm. Uncommon.

ACHNANTHES LINEARIS W. Smith var. PUSILLA Grun. Plate 10, 6g. 17.

Achnanthes linearis W. Smith var. pusitla Grun., FR. HUSTEDT, Ba-cillar. (1930) 198, fig. 277.

Valve elongate-linear with obtuse ends. Length, 0.012 mm; breadth, 0.002. Strize widened in the middle part of the valve, 24 in 0.01 mm. Known from Greenland and Norway.

ACHNANTHES LANCEOLATA Beeb. Plate 2, 529, 11 and 12.

Acknowless lancoolata Brob., FR. Husterr, Bueillan. (1930) 207, fig. 306m.

Valve elliptic-lanceolate, ends obtuse. Length, 0.0136 mm; breadth, 0.005. Upper valve with lanceolate axial area and with a horseshoe area on one of the sides. Lower valve with a quadrate or rectangular central area. Striæ 15 in 0.01 mm. Common in fresh water. Known from Ackiko Lake.

ACBNANTHES LANCEOLATA Brob. var. ELLIPTICA Cleve. Plate 2, fig. 29.

Acknowlhes lauccolata Breb. var. elliptica Cleve, Fr. Hustkor, Baeillar. (1930) 208, fig. 306c.

Valve clliptic, obtuse. Length, 0.015 mm; breadth, 0.0085. Striæ 18 in 0.01 mm. An alpine species, reported from Europe.

ACHNANTHES LANCEOLATA Breb, var. ROSTRATA Hustedt. Plate 2, úg. 20; Plate 8, úg. 8; Plate 10, úg. 18.

Achienthes Innecolate Breb, var. restrate Hustrot, Bacillar. (1930) 207-208, fig. 306b.

Valve elliptical with rostrate ends. Length, 0.012 to 0.018 mm; breadth, 0.005 to 0.0068. Upper valve with a lanceolate axial area and on one side with a horseshoe area. Striæ robust, 12 to 18 in 0.01 mm.

ACHNANTHES LANCEGUATA Breb. var. NIPPONICA var. nov. Plate 12, 6g. 13.

Valve broad-lanceolate, slightly gibbous in the middle, narrowed towards the ends. Length, 0.015 mm; breadth, 0.006. Upper valve with a lanceolate axial area and with a horseshoe area on one side. Lower valve with a rectangular central area. Striæ 12 in 0.01 mm. Not common.

ACHNANTHES PINNATA Huntedt var. JAPONICA Hustrett. Plate 2, dg. 19; Plate 4, dg. 26.

Achiganthes primata Hustedt var. japonica Hustert, Bacillar. a. d. Aokikosec in Japan 161, pl. 5, figs. 12-16.

Valve minute, elliptic and obtuse. Length, 0.0051 to 0.006 mm; breadth, 0.0034. Upper valve with very parrow axial area. Striæ 18 in 0.01 mm. Lower valve with indistinct axial area and with a small central area. Reported only from Aokiko Lake, Nippon.

RHOICOSPHENIA CURVATA (Kata.) Grun.

Rhoicosphenia currenta (Kütz.) Grun., Fr. Hustept, Bacillac. (1930) 211, fig. 311.

Valve clavate. Length, 0.049 mm; breadth, 0.0025. Common in fresh and brackish water.

AMPINIPLEMEA PELLUCIDA KIII. Plate 3, 8g. 3,

Amphipteura pellucida Kütz., Fr. Hustept, Bacillar. (1930) 218. fig. 321.

Valve lanceolate-attenuate. Length, 0.085 mm; breadth, 0.007. Strize very fine. Found in fresh and slightly brackish water. Known from Nippon.

AMPHIPLEURS: PELLUCIDA Kitts, vas. RECTA Kitton. Plate 3, fig. 5.

Amphiplenra pellucida Kütz, var. recta Kitton, Journ. Quekett Micr. Soc. 2: 21, pl. 4, fig. 4.

Valve linear with gently coneate ends. Length, 0.2 mm; breadth, 0.013. Strike 30 in 0.01 mm. According to Kitton variety recta is a marine diatom found in Nippon. Reported by me from a mountain stream in southern China (Foochow, Fukien Province).

PRUSTULIA VIJLGARIS Thwaites. Plate 4, 6g. 11.

Frantalia valgaris Thwaites, Fr. Hustrett, Bacillat, (1930) 221, fig. 327.

Valve linear and obtuse. Length, 0.044 mm; breadth, 0.0085. Strize very fine. Not common. Reported from Nippon.

FRUSTULIA RHOMBOIDES (Ehr.) de Toni. Piole 4. 8g. 19.

Frustulia rhomboides (Ehr.) de Toni, Fr. Hustent, Bacillar, (1930) 220, fig. 324.

Valve rhombic-lanceolate, attenuate with obtuse ends. Length, 0.17 mm; breadth, 0.03. Central nodule small or elongate. Strke 24 in 0.01 mm. Common in fresh water.

FRUSTULIA REOMEDIDES (Ehr.) de Toni var. AMPHIPLEUROIDES Grun. Plate 4.

Frustulia rhomboides (Ehr.) de Toni var. amphipleuroides Grun., Fa. Hustkor, Bacillar. (1930) 221, fig. 326.

Valve lanceolate, obtuse. Length, 0.127 mm; breadth, 0.018. Striæ 24 in 0.01 mm. Reported from Aokiko Lake, Nippon.

FRUSTULIA REOMEGIDES (Ebr.) de Toni var. SAXONICA (Rabbi) de Toni fo. ÇA-PITATA A. Mayer. Plate 4, fig. 12.

Frustulia rhemboides (Ehr.) de Toni var. sazonica (Rabh.) de Toni fo. capitata A. Mayer, Fr. Hustert, Encillar. (1930) 221.

Valve lanceolate with capitate ends. Length, 0.044 mm; breadth, 0.013. Uncommon.

FRUSTULIA ROMBOIDES (Ehr.) de Toni var. SANONICA (Rabh.) de Toni fo. UNDU-LATA Bustedt.

Frustulia rhomboides (Ehr.) de Toni var. saxonica (Rabh.) de Toni fo. undulata Hustert, Bacillar. (1930) 221.

Valve slightly triundulate with capitate ends. Length, 0.056 mm; breadth, 0.012. Rare in Kizaki Lake.

GYROSIGMA ACUMINATUM (Kütz.) Ralis. Plate 9, fig. 14.

Gyrosigma acuminatum (Kütz.) Rabh., Fr. Hustent, Bacillar. (1936) 222-223, fig. 309.

Valve with longitudinal and transverse striæ, 18 in 0.01 mm. Length, 0.136 mm; breadth, 0.02. Common.

GYROSIGMA EUTZINGH (Gron.) Cleve. Plate 3, fig. 7.

Gyrosigma Kützingii (Grun.) Cleve, Fn. Hustyar, Bacillar. (1930) 224, fig. 333.

Valve sigmoid and attenuate. Length, 0.098 mm; breadth, 0.012. Striæ, transversal 18, longitudinal 30, in 0.01 mm. A fresh-water species. Known from Nippon.

GYROSIGMA SCALPROIDES (Robb.) Cleve. Plate 12, 6g. 6.

Gyrosigma scalproides (Rabh.) Cleve, Pa. Husterr, Bacillar. (1930) 226, fig. 338.

Valve sigmoid with broad ends. Striæ, longitudinal 30, transversal 24, in 0.01 mm. Length, 0.064 mm; breadth, 0.008. Known from Europe, America, and Africa.

CALONEIS STATULIA (Ehr.) Clove vor. TUMIDA Hastedt fo. NIPPONICA fo. nov. Piate 5, 6g. 2.

Valve triundulate with broad ends. Length, 0.102 mm; breadth, 0.015. Striæ radiate, 18 in 0.01 mm. Differs from the type in its broad and long ends.

CALONEIS SILICULA (Ehr.) Cleve var. TRUNCATULA Gree. Plate 4, fig. 17.

Caloncis silicula (Ehr.) Cleve var. truncatula Grun., Fr. Hustent, Bacillar. (1930) 238, fig. 363.

Valve slightly undulate in the middle part. Central area a broad fascia. Length, 0.022 mm; breadth, 0.0058. Striæ 24 in 0.01 mm. Common in fresh water.

CALONEIS SILICULA (Ehr.) Clove var. BAICALENSIS Skvortzow and Mayer. Plate 3, 6g. 0.

Caloneis silicula (Ehr.) Clove var. baicalensis Skvorrzow and Meyer, Contribut. diatoms of Baikal Lake (1928) 12, pl. 1, fig. 44.

Valve linear, triundulate with broad capitate ends. Striæ 24 in 0.01 mm. Central area with a broad stauros. Length, 0.061 mm; breadth, 0.011. Reported from Baikal Lake, Siberia.

NEIDIUM BITCHCOCKH Ebr. Plate 4, dg. 1.

Neidium Hitchcockii Ehr., A. Schmidt, Atlas Diatom. pl. 49, figs. 35-36.

Valve elliptic, triundulate with rostrate ends. Length, 0.057 mm; breadth, 0.013. Striæ 18 in 0.01 mm. Common in freshwater.

NEIDIUM PRODUCTUM (W. Smith) Ulere to, CONSTRICTA Hastedt. Plate 4, fig. 2.

Neidium productum (W. Smith) Cleve fo, constricta Hustunt, Bacillar, (1930) 246.

Valve constricted with apiculate ends. Length, 0.049 mm; breadth, 0.011. Striæ 24 in 0.01 mm.

NEIDIUM AFFINE (Phr.) Clere fo. MERCYNICA (A. Moyer) Hust. Plate 4, dy. 6.

Neidlam affine (Ehr.) Cleve for heregoides (A. Mayer) Hustert, Bacillar. (1930) 243.

Neidium affine var. genuina CLEVE, Bacillar. d. Regensburger Gewässer (1913) 109, pl. 10, fig. 33.

Valve lanceolate with obtuse ends. Length, 0.037 mm; breadth, 0.01. Striæ 20 to 24 in 0.01 mm. Known from Europe.

NEIDIUM BISULCATUM (Lagerat.) Clave var. NIPPONICA var. nov. Plote 5, fig. 1; Plate 4, fig. 5.

Valve linear-lanceolate with slightly attenuate ends. Length, 0.034 to 0.06 mm; breadth, 0.006 to 0.01. Strice 20 to 30 in 0.01 mm. Differs from the type in its attenuate and acute ends. The type is common in alpine regions.

NEIDIUM DEBICM (Ehr.) Cleve. Plate 12, dg. 10.

Neidium dubium (Ehr.) Cleve, Fr. Hustert, Bacillar. (1930) 246, fig. 385.

Valve broad-lanceolate with acuminate ends. Length, 0.034 mm; breadth, 0.01. Strize 13 in 0.01 mm. Common in fresh and brackish waters.

NEIDIUM KIPPONICA sp. nov. Plate S. Gr. 1.

Valve large, lanccolate with obtuse ends. Striæ oblique, 18 in 0.01 mm, crossed by longitudinal marginal band. Axial area

narrow, widened on the middle part of each end. Central area broad. Length, 0.142 mm; breadth, 0.025. A distinct species; it resembles *Navicula* sp. figured in A. Schmidt, Atlas Distom. pl. 49, fig. 1, from Monticello, New York.

NEIDIUM KOZLOWI Mercick, var. NIPPONICA var. nov. Plate 12, fig. 19.

Valve linear with parallel margins and rostrate ends. Striæ oblique, 24 to 28 in 0.01 mm. Axial area narrow. Central area broad. Length, 0.34 mm; breadth, 0.0062. Differs from variety parva Meresch. and variety hankensis Skv. in its rostrate ends and its size.

Valve lanceolate with attenuate ends. Striæ oblique, 16 to 17 in 0.01 mm. Length, 0.096 to 0.1 mm; breadth, 0.02 to 0.025. This new variety resembles Neidium sp. in A. Schmidt, Atlas Diatom, pl. 49, fig. 1, and Neidium affine var. amphirhynchus Ehr. fo. maxima Cleve, Navicul. Diatom. 69.

NEIDIUM OBLIQUE-STRIATUM A. S. var. ROSTRATA var. nov. Plate 4, dg. 26.

Valve with rostrate ends. Striæ oblique, 24 in 0.01 mm. Length, 0.061 mm; breadth, 0.015. Differs from the type in its rostrate ends.

NEIDIUM OBLIQUE-STRIATUM A. S. vor. APICULATA var. nov. Plate 4, fig. 24,

Valve lanceolate with obtuse and apiculate ends. Length, 0.044 nm; breadth, 0.012. Strise oblique, 14 in 0.01 mm. Not common.

DIPLONEIS OVALIS (Hills) Cleve. Plate 2, 6g. 27.

Diploneis ovalis (Hilse) Cleve, Fr. Husterr, Bacillar. (1930) 249, 6g. 390.

Valve elliptic with broad and rounded ends. Length, 0.028 to 0.08 mm; breadth, 0.013 to 0.015. Central nodule large, rounded. Transverse rows of alveoli 9 to 10 in 0.01 mm, radiate at ends. Puncta 14 in 0.01 mm. Common in fresh water. Reported from Nippon. According to Fr. Hustedt, the Nippon forms of Diploneis ovalis are always large with double rows of alveoli. Such forms I find it desirable to separate.

DIPLONEIS OVALIS (Hilse) Cleve var. OBLONGELLA (Naegell) Cleve. Plate 2, 22, 24.

Diploneis ovalis (Hilse) Cleve var. oblongella (Naegell) Cleve, Fr. HUSTEDT, Bacillar. (1930) 249, fig. 391.

Valve linear-elliptic. Length, 0.044 to 0.046 mm; breadth, 0.013 to 0.017. Rows of alveoli 10 to 11 in 0.01 mm. Very common in Kizaki Lake. Known from Aokiko Lake.

٦

DIPLOMEIS PUELL'A (Schum.) Cleve. Plate 2, 4g. 2.

Valve elliptic. Length, 0.023 mm; breadth, 0.012. Central nodule quadrate. Furrows narrow. Costæ 12 to 13 in 0.01 mm. Alveoli indistinct. Known from fresh and brackish waters.

DIPLONEIS MARGINESPRIATA Bustedt. Plate 12, 2g. 5.

Diploneis marginestriata Husterr, Bacillar. (1930) 250, fig. 393.

Valve elongate-elliptic with broad ends. Length, 0.032 mm; breadth, 0.01. Central nodule quadrate. Furrow broad, linear. Costæ 21 in 0.01 mm, radiate at the ends. Known from alpine lakes in Europe. Reported from Ackiko Lake, Nippon.

DIPLONEIS SMITHH (Breb.) Cleve var. NIPPONICA vor. nov. Plate 2, figs. 1 and 2.

Valve elliptic. Length, 0.068 to 0.1 mm; breadth, 0.03 to 0.047. Central nodule quadrate. Terminal nodules distant from the ends. Furrows broad, inclosing a space one-fourth as broad as the valve. Costæ 5 to 6 in 0.01 mm, with double rows of alveoli, forming oblique lines. Differs from the type by its more elongate and attenuate ends. Very common in Kizaki Lake. The typical Diploneis Smithii is known as a brackish-water species.

DIPLONEIS SMITHH (Breb.) Cleve vac. ORLONGELLA var. nov. Plate 9, eg. 1.

Valve elongate-elliptic with broad ends. Length, 0.098 to 0.1 mm; breadth, 0.035 to 0.039. Central nodule quadrate. Furrow broad-lanceolate, inclosing a space one-third as broad as the valve. Costæ 6 in 0.01 mm, with a double row of alveoli. Common in Kizaki Lake.

DIPLONEIS OCULATA (Breb.) Cleve. Pinte 2, 0g. 4.

Diplonois aculata (Breb.) Cleve, Fr. Hustert, Bacillar. (1930) 250, fig. 392.

Valve clongate-elliptic. Length, 0.024 mm; breadth, 0.0076, Central nodule quadrate. Furrows linear. Costæ 24 in 0.01 mm. Reported from Ackiko Lake.

DIPLONEIS OCCUEATA (Breb.) Cleve var. NIPPONICA vac. nov. Plate 14, fig. 3.

Valve minute, elliptic with attenuated and rounded ends. Striæ fine, marginal, 18 in 0.01 mm. Length, 0.012 mm; breadth, 0.006. Lateral area hyaline. Central nodule quadrate. Furrow linear, interrupted in the middle part. Diploneis oculatu is reported from Ackiko Lake.

Diploneis elliptica (Kütz.) Clave var. LADOGENSIS Cleve. Plate 2, dgs. 2 and 6, Diploneis elliptica (Kütz.) Cleve var. ladogensis Cleve., Diatom. Finland (1893) 43, pl. 2, fig. 9.

Valve elliptic. Length, 0.027 to 0.035 mm; breadth, 0.015 to 0.023. Transverse costæ irregularly anastomosing with a few, longitudinal, undulating costæ. Known from Europe.

STAURONEIS PROENICENTERON Ehr. Plate 5, 4x, 19,

Stauroncis phoenicenteron Ehr., Fr. Huster, Bucillar. (1930) 255, fig. 404.

Valve lanceolate, with attenuate ends. Length, 0.15 mm; breadth, 0.028. Striæ 14 in 0.01 mm. Common in fresh water.

STAURONEIS PREMICENTERON Ebr. fo. NIPPONICA to, nov. Plate 3, Sg. 21; Plate 9, Sg. 4,

Valve lanceolate, broad with acute ends. Strike radiate and somewhat curved, 14 to 18 in 0.01 mm. Length, 0.085 to 0.11 mm; breadth, 0.024 to 0.025. Differs from the type in its short valve.

STAURONEIS ANCEPS Phr. Plate 5, 6g. 12.

Stauroncis anceps Ehr., Fr. HUSTEDT, Bacillar. (1930) 256, fig. 405.

Valve lanceolate with attenuate ends. Striæ 18 in 0.01 mm. Length, 0.049 to 0.085 mm; breadth, 0.011 to 0.02. Common in fresh water.

STAURUNERS ANCEPS Ehr. fo. GRACILIS (Ehr.) Cleve. Plate 5, Sg. 24.

Stauroucis anceps Ehr. fo. gracilis (Ehr.) Cleve, Fr. HUSTEDT, Bacillar. (1930) 256, fig. 406.

Valve with long capitate ends. Length, 0.08 mm; breadth, 0.013. Striæ 15 in 0.01 mm. Rare.

STAURONEIS ANCEPS Ehr. var. LINEARIS (Ehr.) Cieve. Pinte 5, ag. 14.

Stauroneis anceps Ehr. var. linearis (Ehr.) Cleve, Fr. Hustedt, Ba-eillar. (1930) 256, fig. 407.

Valve linear with rostrate ends. Length, 0.045 mm; breadth, 0.0085. Striæ 24 in 0.01 mm. Uncommon.

STAURONEIS SMITHIL Gron. Plate 3, 8g, 11,

Stauroncis Smithii Gron., Fr. Hustept, Bacitlar. (1930) 261, fig. 420.

Valve lanceolate, constricted in the middle part, rostrate at the ends. Central area a short fascia. Length, 0.016 mm; breadth, 0.0042. Common in fresh water.

STAURONEIS SMITHII Grun, var. INCISA Pantoesek. Piata 4, Sg. 27.

Stauroncis Smithii Grun, var. incisa Pantocsek, Fs. Hustest, Bacillac. (1930) 261, fig. 421.

Valve lanceolate, attenuate with long ends. Length, 0.04 mm; breadth, 0.008. Strice 24 in 0.01 mm. Rare.

STACRONEIS SAUTHIL Gran. var. NIPPONICA ver. nov. Plate 10, Sg. 24.

Valve slightly triundulate. Ends long, acuminate. Length, 0.034 mm; breadth, 0.0068. Strice 28 to 30 in 0.01 mm. Differs, from variety incise in its undulate margins.

ANOMICONEIS EXILIS (Kilis.) Cleve vas. SIPPONICA vas. nov., Plate 11, fig. 12.

Valve sublinear-lanecolate, asymmetrical, convex, with attenuated, obtuse ends. Length, 0.044 mm; breadth, 0.0051. Striæ indistinctly punctuate, striolate, 18 to 20 in 0.01 mm. Not common in Kizaki Lake.

NAVIGULA COSPIDATA Kiliz. Plate 6, 5g. 18,

Navicula cuspidata Kütz., Fn. Husters, Bacillar. (1930) 268, fig. 430.

Valve lanceolate, acute. Strim parallel, 15 in 0.01 mm. Length, 0.096 mm; breadth, 0.022. Uncommon.

NAVICULA HOLOPHILA (Grun.) Cleve in MINOR Kathe. Plate 4, Sr. 18.

Navicula kolophila (Grun.) Cleve to, minor Kolbe, Kieselahten des Sperenberger Salzgebiets (1927) 67, pl. 1, fig. 4.

Valve lanceolate, acute. Striæ fine, slightly radiate; transversal striæ 18, longitudinal 30, in 0.01 mm. Axial area narrow. Length, 0.062 mm; breadth, 0.017. Known from brackish water in Europe.

NAVICULA LAPINOSA Kenseke var. NIPPONICA vor. nev. Plate 5, fig. 32.

Valve elliptica. Striæ radiate, 18 to 19 in 0.01 mm. Central area a broad stauros, widened and truncate outwards. Axial area very narrow. Length, 0.015 mm; breadth, 0.0065. Navicula lapidosa is known from Europe.

NAVICULA ROTÆANA (Robb.) Grun. Plate 4, fig. 25.

Navicula Reference (Rabb.) Grue., Fr. Husterr, Bacillac. (1930) 275, fig. 445.

Valve elliptic, rounded. Striæ fine, 20 to 25 in 0.01 mm. Central area a broad stauros. Length, 0.015 mm; breadth, 0.0068. An alpine species.

NAVICULA MUTICA Kets. Plate 15, 6g. 5.

Navicula matica Kütz., Fg. Hustent, Bacillar. (1980) 274, fig. 453a.

Valve elliptic-lanceolate. Strim distinctly punctate, 20 in 0.01 mm. Central area with an isolated punctum. Length, 0.022 mm; breadth, 0.0085. Common in fresh water.

NAVICULA PERPUSILLA Gran. Plate 9, 6g. 6.

Navicula perpusilla Gron., FR. HUSTEDY, Bacillar. (1930) 278, fig. 459.

Valve broad-elliptic. Strice very fine, 30 in 0.01 mm. Axial area broad. Length, 0.01 mm; breadth, 0.0042. Uncommon in Kizaki Lake.

NAVICULA CONFERVACEA Kütz, fo. NIPPONICA fo. nov. Plote 2, 6g. 7; Flate 4, 1 fg. 23.

Valve elliptic, attenuate at the ends. Striæ radiate, marginal, 15 to 16 in 0.01 mm. Axial and central areas broad-lanceolate. Length, 0.014 to 0.015 mm; breadth, 0.0068 to 0.007. Navicula conferencea is common in the Tropics.

NAVICULA AMERICANA Ehr. Plate 2, fig. 23.

Narricula americana Ehr., FR. HUSTEDT, Bacillar. (1930) 280, fig. 464.

Valve linear, obtuse. Length, 0.088 mm; breadth, 0.02. Strice 15 in 0.01 mm. Not common in Kizaki Lake.

NAVICULA LAMBDA Cleve var. DENSISTRIATA var. nov. Plote 4, 6g., 5.

Valve linear. Strixe in the middle part of the valve 24, in the ends about 30, in 0.01 mm. Length, 0.045 mm; breadth, 0.0085. The Nippon variety differs from the type in its close strixe. Navicula Lumbda is known from Demerara River, South America.

NAVICELA PEPELA Este. Plate 12, fig. 15.

Navioula papula Kütz, var. rectangularis (Greg.) Grun., Fr. Hustmar, Bacillar. (1930) 281, fg. 467b.

Valve linear, Length, 0.039 mm; breadth, 0.008. Striæ 24 in 0.01 mm. Common.

NAVICULA PUPULA Kütz, var. CAPITATA Biotest. Plate 4, fig. 10.

Navicula pupulu Kütz, var. capitata Hosteot, Bacillar. (1930) 281, 62, 467c.

Valve with capitate ends. Strix 14 to 20 in 0.01 mm. Length, 0.013 to 0.028 mm; breadth, 0.004 to 0.006. Not common.

NAVICULA CRUCICULA (W. Smith) Donkin yas, CAPITATA yas, nov. Pinte 5, 6g. 11.

Valve elliptic with capitate ends. Strize closer towards the ends, 15 to 16 in 0.01 mm. Axial area very narrow, somewhat widened in the middle part. Length, 0.02 mm; breadth, 0.006. Differs from the type in its capitate ends.

NAVICULA AQUEDUCTÆ Krasske fo. MINUS Krasske. Plote 5, 8g. 10.

Navicula aqueductæ Krasske fo, minus Krasske, Bacillar, Veget. Niederhessens (1925) 44, pl. 2, fig. 23. Valve slightly siliceous, linear, constricted in the middle part, attenuate and capitate at the ends. Length, 0.014 mm; breadth, 0.0028. Reported from Europe.

NAVICULA MURALIS Gron. Plate 4, fig. 11.

Nevicula maralis Grun., Fr. Hustert, Bacillar. (1930) 288, fig. 482. A minute elliptical valve with rounded ends. Striæ in the middle 28 to 30, at the ends 40, in 0.01 mm. Common in fresh water.

NAVICULA ATOMARIUS op. nov. Plate 2, fig. 13.

Vaive linear, slightly convex and obtuse. Length, 0.009 mm; breadth, 0.0034. Striæ very fine, about 40 in 0.01 mm. Central area round, axial area linear and narrow. Differs from Nacicula pelliculosa (Breb.) Hilse in its enlarged central area.

* NAVICULA ATOMUS (Nescell) Gron, var. NIPPONICA var. nov. Plate 10, fig. 16.

Yalve elliptical. Strix radiate, in the middle 16, at the ends 20, in 2.01 mm. Length, 0.015 mm; breadth, 0.005. Navicula atomus is smaller than the Nippon variety.

NAVICULA MINUSCULA Gras. Plate 11. 6g. 11.

Navicula minuscula Gron., Fr. Hustenr. Bacillar. (1930) 288, 6g. 483. Valve slightly siliceous, lanccolate. Length, 0.01 mm; breadth, 0.003. Common.

NAVICULA PUSIO Cleve. Plate 4, Sgs. 20 and 24; Plate 11, Sg. 22,

Nationla Pusio Cleve, Synopsis of the Navie. Diatoms (1895) 2, 3, pl. 2, fig. 3.

Valve elliptical, with broad rostrate ends. Axial area very narrow, central area small. Strike fine, radiate, about 25 to 30 in 0.01 mm, closer towards the ends. Length, 0.014 to 0.018 mm; breadth, 0.006 to 0.008. Reported from Rotorna Lake, New Zealand, and from Aokiko Lake, Nippon.

NAVICULA PUSIO Cleve var. ARCUATA (Pantocrek) Skvortzon. Plate 2. fig. 35.

Navicula arcuata PANTOCSEK, Fossile Bucillurien Ungarus (1903) 3, pl. 6, fig. 97.

Valve larger than the type. Striæ very fine. Axial area narrow, widened in the middle. Length, 0.027 mm; breadth, 0.013. The typical Navicula areata has radiate striæ.

NAVICULA PSEUDOSCUTIFORMIS Restedt. Plate 4. dg. 15.

Navicula pseudosculiformis Husterr, Bacillars (1930) 29t, fig. 495.

Valve broad-cliiptical, about circular. Striæ radiate, 18 in 0.01 mm. Length, 0.0085 nun; breadth, 0.007. Known from Europe.

NAVICULA CRYPTOCEPHALA Kütz. Plate 19. 6x. 3.

Navicula oruptaeophala Kütz., Fu. Husteur, Bacillar. (1930) 295, fig. 490.

Valve Ianceolate, attenuate. Strike radiate, 18 in 0.01 mm. Length, 0.02 mm; breadth, 0.005. Common in fresh water.

NAVICULA CRYPTOCEPHALA Kiltz, var. VENETA (Kita.) Grun. Plate 7, 6g. 14.

Navicula cryptocephala Kütz, var. veneta (Kütz.) Grun., Fr. Hustent, Bacillar. (1930) 295, 6g. 497a.

Valve lanceolate, attenuate. Strice radiate, 13 to 14 in 0.01 mm. Axial area narrow. Length, 0.023 mm; breadth, 0.005. Common in fresh water.

NAVICULA SALINARUM Crun, var. NIPPONICA var. nov. Plate 5, fig. 21.

Valve lanceolate, elliptical and acuminate. Striæ robust, 9 in 0.01 mm, in the middle of unequal length. Length, 0.03 mm; breadth, 0.0085. The typical *Navicula salinarum* has the striæ 14 to 16 in 0.01 mm and is known from brackish water.

NAVICULA RHYNCHOCEPHALA Külz, Plate 5, 2g. 2.

Navioula rhynchocophala Kütz., Fr. Husteov, Bacillav. (1930) 296, fig. 501.

Valve lanceolate with attenuate ends. Striæ radiate, 12 to 13 in 0.01 mm. Axial area narrow. Length, 0.035 mm; breadth, 0.0085. Reported from many parts of the world.

NAVICULA ROSTELLATA Kūtz. Plate S. Be. 3.

Navicula restellata Kütz., A. Schmidt, Atlas Diatom. pl. 47, figs. 27-20.

Valve lanceolate with attenuate ends. Striæ radiate in the middle, of unequal length, 11 in 0.01 mm. Length, 0.035 mm; breadth, 0.0076. Known from Nippon.

MAVICULA ROSTELLATA KEIL TOD NIPPONICA VAR. ROT. Plate 5, Sg. 22.

Valve more attenuate with slightly capitate ends. Striæ 9 to 10 in 0.01 mm. Length, 0.028 mm; breadth, 0.006. Differs from the type in its margins and capitate ends. Uncommon.

NAVICULA RADIOSA Kūtz. Plate 5, flg. 8.

Navioule radiosa Kütz., Fr. HUSTEDT, Bacillar. (1930) 299, fig. 513.

Valve narrow-lanceolate, acuminate. Striæ 9 in 0.01 mm. Length, 0.072 mm; breadth, 0.01. Common in fresh water.

NAVICULA MENISCULUS Schumann. Plate 5, 5g. 16.

Nuclicula menisculus Schumann, Fr. Hustedt, Bacillar. (1930) 301, fig. 517.

Valve lanceblate, broad. Striæ robust, not lineblate, 9 in 0.01 mm, of unequal length in the middle. Central area broad. Length, 0.045 mm; breadth, 0.013. Common.

NAVICULA GLOBULIFERA Bustedt. Plate 5, 6g. 7.

Navioula globulifera Hustwot, Bacillar, aus dem Ackikosce in Japan 164, pl. 5, fig. 7.

Valve lanceolate with capitate ends. Strice divergent in the middle, convergent at the ends. The middle strice 8 to 9, the end strice 14, in 0.01 mm. Length, 0.068 mm; breadth, 0.01. Only known from Nippon.

NAVICULA GLOBULIFERA Rustedt var. NIPPONICA var. nov. Piete 3. 0g. 10.

Valve more elongate with noncapitate ends. Striæ 12 in 0.01 mm. Length, 0.083 mm; breadth, 0.01. Differs from the type in its attenuate and noncapitate ends.

NAVICULA PALAISIRNSIS Gran, var. LANCROLA Gran. Plate 5, 6g. 9.

Navicula falaisiensis Grun, var. lanccola Gron., Vn. Hustzpt, Bacillar, (1939) 302, fig. 524.

Valve linear-lanceolate with rounded and truncate ends. Strike fine, radiate, 18 to 22 in 0.01 mm. Axial area very narrow. Central area small. Length, 0.017 mm; breadth, 0.005. Reported from slightly brackish and fresh waters.

NAVICULA FALAISIENSIS Grue, var. NIPPONICA vor. nov. Plate 6, \$2, 15,

Valve lanceolate, rostrate. Striæ fine, slightly radiate, 18 in 0.01 mm. Axial area very narrow. Differs from the type in its subrostrate or rostrate ends and different number of striæ.

NAVICULA DICEPHALA (Ehr.) W. Smith. Plate 2, 6g. 4.

Navicula disceptula (Ehr.) W. Smith, Fr. Hustent, Bacillar. (1930) 302, fig. 526.

Valve linear-lanceolate with rostrate ends. Striæ radiate, 11 in 0.01 mm. Length, 0.032 mm; breadth, 0.012. Common.

NAVICULA EXIGEA (Green) O. Mull. Plate 4, ag. 9.

Naricala exigua (Greg.) O. Moli., Fr. Husvedt, Racillar, (1920) 305, fig. 528.

Valve linear-lanceolate with capitate ends. Striæ 16 in 0.01 mm. Length, 0.017 mm; breadth, 0.005. A fresh-water diatom.

NAVICUDA SUIDAS Krasske. Pinte 5, 6e, 13.

Navirala similis Krasske, Fr. Hustept, Bacillot. (1990) 303, fig. 528.

Valve minute, lanceolate with acute ends. Striæ distinct, 15 in 0.01 mm. Axial and central areas narrow. Length, 0.01 mm; breadth, 0.005. Reported from Europe.

NAVICULA ANGLICA Ratts. Plate 5, 62, 18,

Navicula anglica Ralfs., Fr. Hustert, Bacillar. (1930) 303, figs. 530-531.

Valve elliptic with rostrate ends. Striæ slightly radiate, 12 to 13 in 0.01 mm. Axial area narrow, widened in the middle part. Length, 0.022 mm; breadth, 0.008. Common in fresh water.

NAVICULA PLACENTULA (Ehr.) Gran. fo. ROSTRATA A. Mayer. Plate 6, fig. 5.

Navioula placentula (Ehr.) Grup. fo. rostrata A. Mayer, Fn. Hustent, Bacillar. (1930) 304, fig. 583.

Valve elliptic-lanceolate with rostrate ends. Striæ robust, 7 in 0.01 mm. Length, 0.062 mm; breadth, 0.023. Reported from Europe, Siberia, New Zealand, and America.

NAVICULA PLACENTULA (Ehr.) Gran. fo. NIPPONICA fo. nov. Plate 10, 8x. 20.

Valve robust, short-lanceolate with rostrate ends. Striæ 12 in 0.01 mm. Length, 0.024 mm; breadth, 0.012. This form differs from form rostrata Mayer in its shorter valve.

NAVICULA LANCEOLATA (Agardh) Kütz. Plate 5, ag. 4; Plate 10, fg. 6.

Navicula lanccolata (Agardh) Kütz., Fr. Husteut, Bacillar, (1930) 305, fig. 540.

Valve lanceolate, acuminate. Striæ lineolate, 9 to 12 in 0.01 mm. Length, 0.059 to 0.06 mm; breadth, 0.0085 to 0.01. Known from Nippon.

NAVICULA LANCEOLATA (Agardh) Nett. ver. CYMBULA (Donk.) Cieve. Plate 5, 0g. 17.

Navioula lauccoluta (Agardh) Kütz, var. cymbula (Donk.) Gleve. Van Heurek, Synopsis pl. 7, fig. 32.

Valve lanceolate, acuminate. Striæ radiate, lineate, widened, in the middle 5, at the ends 8, in 0.01 mm. Length, 0.085 mm; breadth, 0.013. Reported from Nippon.

NAVICULA HASTA Pantorrek. Plate 5, 6g. 1.

Naviculu hasta PANTOCSEK, Fossil, Diatom. Ungarn (1903) 3, pl. 5, fig. 74; pl. 14, fig. 213.

Valve lanceolate with attenuate, not cuneate, rounded ends. Striæ lineate, robust, 7 to 8 in 0.01 mm, radiate, widened in the middle part. Length, 0.096 mm; breadth, 0.017. Our specimens are different from the forms described by Fr. Meister from Nojiri and Suwa Lakes in Nippon.

NAVICULA PEREGRINA (Ehr.) Esta, var. CUNEATA var. nov. Plate 5, dg. 24.

Valve lanceolate, broad with cuneate ends. Strize radiate divergent at the ends, 9 in 0.01 mm. Length, 0.049 mm;

breadth, 0.0085. Differs from the type in its broad valve and its ends.

NAVICULA LACUSTRIS Greg. Plata S, Rg. 6; Plate R, Bg. 9.

Navicula lacustris Greg., CLEVE, Diatoms Finland (1893) 34, pl. 2, figs. 3, 12, 14.

Valve elliptical and acuminate. Striæ punctate. Length, 0.02 to 0.044 mm; breadth, 0.01 to 0.015. Striæ 16 in 0.01 mm. Reported from Europe, Asia, and America.

NAVICULA AMPRIROLA Cleve. Plate 9, fig. 20.

Navicula amphibola Cleve, FR. I(USTEDI, Bacillar. (1930) 309-310, fig. 554.

Valve lanceolate with attenuate ends. Strige punctate, 12 in 0.01 mm. Length. 0.047 mm; breadth, 0.017. Not common in Kizaki Lake.

NAVICULA PALEA sp. nov. Plate 8, fig. 4.

Valve linear, lanceolate, narrow-attenuate with slightly capitate ends.' Striæ fine, radiate, 15 to 16 in 0.01 mm. Axial and central areas narrow and linear. Length, 0.029 mm; breadth, 0.0037. Differs from Navicula radiosa, N. cari, and N. cineta in its narrow central area and capitate ends.

NAVICULA KIZAKENSIS sp. nov. Plate 16, fig. 12.

Valve minute, lanceolate, rounded in the middle, attenuate and capitate at the ends. Striæ radiate, about 30 in 0.01 mm. Axial area narrow, linear, widened in the middle part. Length, 0.011 mm; breadth, 0.0042. Differs from Navicula Schadei Krasske in its narrow central area and coarser striæ.

NAVICULA BRERMI Hastedt fo. ELONGATA fo. nov. Ptote 3, 82, 3.

Valve linear-elliptic with parallel margins and cuneate ends. Strike parallel, coarse, 18 to 20 in 0.01 mm. Axial area narrow, linear, widened in the middle part. Length, 0.032 mm; breadth, 0.0068. Differs from the type in its longer valves. The type is reported from Aokiko Lake, Nippon.

PINNULARIA LEPTOSOMA Grun. Plate 8, 5g. 8.

Pinnularia leptosoma Grun., Fr. Hustent, Racillar. (1930) 316, fig. 567.

Valve linear, narrowed towards the ends. Strize radiate, 15 in 0.01 mm. Length, 0.032 mm; breadth, 0.005. A freshwater species, especially of alpine regions.

^{&#}x27;Beitrage zur Keontniss der Diotomeenstera Sachsens (1929) 356, fig. 11a, b.

PINNULARIA LEPTOSOMA Grain, var. MIPPONICA vor. nov. Plate 8, fg. 45.

Valve linear, attenuate. Strise fine, 14 in 0.01 mm. Axial area narrow, central area a broad fascia. Length, 0.066 mm; breadth, 0.068. Differs from the type in its longer valves.

PINNULARIA MOLARIS Gran. Plate 6, 6g. 15.

Pinnetarie molecus Grun., Fr. Hustert, Bacillar. (1930) 316, fig. 568.

Valve minute, lanceolate, with radiate strix 18 in 0.01 mm. Length, 0.025 mm; breadth, 0.005. Common in fresh water.

PINNULARIA MESCLECTA (Ehr.) W. Smith. Plate 3, fig. 19; Plate 12, fig. 11.

Pinnularia mesolepta (Chr.) W. Smith., Fr. Hustent, Bacillar. (1930) 319, 59, 575.

Valve triundulate with capitate ends. Strim radiate, 10 to 12 in 0.01 mm. Length, 0.022 mm; breadth, 0.006 to 0.012. Common.

PINNULARIA DIVERGENTISSIMA Gran. Plate 12, Sc. 24.

Pinnalaria divergentissima Grun., VAN HEURCK, Synopsis (1880-1881), pl. 6, fig. 32.

Valve linear, attenuate towards the ends. Strize strong, radiate, 15 in 0.01 mm, with a broad fascia. Length, 0.047 mm; breadth, 0.0068. Uncommon.

PINNULARIA MICROSTAURON (Ehr.) Cleve. Plate 7, fig. 6.

Pinnularia microstaurea (Ehr.) Cleve, Fr. Husteet, Bacillar. (1930), 020, fig. 582.

Valve linear-lanceolate with parallel margins and rounded subrostrate ends. Strise radiate, 10 in 0.01 mm. Length, 0.056 mm; breadth, 0.01. Common.

PINNULARIA MICROSTAURON (Ebr.) Cleve var. AMBIGUA Melater fo. DIMINUTA Grun, Plate 7, fig. 18.

Pinnaharia mirrostancon (Ehr.) Cleve var. ambigua Meister fo. dimiunta Grun., Fr. Hustkot, Bacillar. (1930) 321-322, fig. 585.

Valve lanceolate. Strix radiate, 14 in 0.01 mm. Length, 0.03 mm; breadth, 0.006. Common in fresh water.

PINNULARIA MICHOSTAURON (Ehr.) Cleve for, NIFPONICA var. nov. Flato 6, 8g. 5; Plate 9, 6g. 19.

Valve undulate with obtuse ends. Strix 10 to 11 in 0.01 mm. Length, 0.045 to 0.056 mm; breadth, 0.0085 to 0.011. Differs from the type in its broad obtuse ends.

PINNULARIA MICROSTAURON (ELD.) CHEEF VAR. KIZAKENSIS VAR. ROT. Plate 6. 62. 7.

Valve with parallel margins and attenuate ends. Striæ robust, 9 to 13 in 0.01 mm. Central area a broad fascia. Length,

0.034 to 0.062'mm; breadth, 0.0033 to 0.013. Differs from the type in its attenuate ends. Common in Kizaki Lake.

PINNULARIA KARELECA Cleve var. JAPONICA Hodedt. Plate 6, 62, 4.

Phonularia karelica Cleve var. japonica Hustent, Bacillar. d. Aoki-kosee in Japan 165, pl. 5, fig. 3.

A distinct form with slightly capitate ends. Striæ 14 in 0.01 mm, crossed by a hand. Length, 0.061 mm; breadth, 0.012. Known from Aokiko Lake.

PINNULARIA KARELICA Cleve var. JAPONICA Bustedt fo. OBTUSA fo. nov. Plate 6. ag. 3.

A small obtuse form, with strike 12 to 13 in 0.01 mm, with narrow axial area. Length, 0.044 mm; breadth, 0.013. Uncommon.

PINNULARIA KARELIUA Cieve var. INSULARIS vor. nov. Plote 6, fig. 12.

Valve linear with capitate ends. Striæ 8 to 9 in 0.01 nun, crossed by a narrow band. Central area elliptical. Differs from variety *japonica* Hustedt in its broad axial area and larger valve.

PINNULARIA LEGUMEN Ehr. Plate 8, fig. 6.

Pinnularia legumen Ehr., FR. HUSTEDT, Bacillar. (1930) 322, fig. 587.

Valve strongly triundulate with capitate ends. Striæ 8 in 0.01 mm. Length, 0.088 mm; breadth, 0.014. Reported from Nippon.

PINNULARIA LEGUMEN Elst. var. NIPPONICA var. nov. Plate 7, fig. 4.

Valve with slightly undulate margins. Striæ 10 in 0.01 mm. Length, 0.078 mm; breadth, 0.015. Differs from the type in its broader and more obtuse valve.

PINNULARIA PLATYCEPHALA (Elie.) Ciere. Plate 6, 5g. 1.

Pinnularia platycephala (Ehr.) Gleve, FR. HUSTEDT, Bucillar. (1930) 324, fig. 593.

A robust species with triundulate margins. Strize divergent in the middle, convergent at the ends, 8 in 0.01 mm. Length, 0.09 mm; breadth, 0.019. Common in lakes.

PINNULARIA PLATYCEPHALA (Ebr.) Cieve var. HATTORIANA Meister. Plate 6, 6g. 2.

Pinnularia platycephala (Ebr.) Cleve var. Hattoriana Meisten, Beiträge zur Baeillar. Japans (1914) 2, 228-229, pl. 8, 6gs. 6, 7.

A distinct diatom with capitate ends and large comma-shaped terminal fissures. Length, 0.079 mm; breadth, 0.01. Striæ 8 in 0.01 mm. This diatom was named by Dr. Fr. Meister in

honor of D. Hattori, of the Botanical Institute, Imperial University, Tokyo.

PINNULARIA MONTANA United to MINOR to, nov. Plate 9, \$2, 9,

Valve lanceolate. Striæ short, 8 to 9 in 0.01 mm. Length, 0.051 to 0.068 mm; breadth, 0.012 to 0.015. Longitudinal band indistinct. The typical *Pinnularia montana* was described from Aokiko Lake and is twice as large (length, 0.12 to 0.15 mm).

PINNULARIA BREVICOSTATA Cleve. Plate 12, fig. 1.

Pinnularia montana Hustedt var. sinica Seventzow, Alpine diatoms of South China (1920) 43, pl. 2, fig. 14; pl. 3, fig. 18.

Valve linear with obtuse ends. Striæ parallel, with a longitudinal band, 10 to 11 in 0.01 nm. Length, 0.105 nm; breadth, 0.017. Reported from Foochow, southern China.

PINNULARIA GIRBA Ehr. Plate 7, figs. 2 and 3.

Pinnularia gibba Ehr., Fr. Husredt, Bacillar. (1930) 327, fig. 600a, b.

Valve lanceolate with capitate ends. Central area a broad fascia. Length, 0.066 to 0.068 mm; breadth, 0.008 to 0.01. Striae 9 to 11 in 0.01 mm. Common in fresh water.

PINNULARIA GIBBA EM. fo. SUBUNDULATA Mayer. Plate 7, fig. 15.

Pinnularia gibba Ehr. fo. subundulata Mayer, Fa. Hostkot, Bacillat. (1930) 327, fig. 601.

Valve slightly triundulate with rostrate, minutely capitate ends. Striæ divergent in the middle, convergent at the ends, 8 in 0.01 mm. Length, 0.069 mm; breadth, 0.01. Common.

PINNULARIA CIBRA Chr. var. NIPPONICA var. nov. Plate 7, 5s. 10.

Valve slightly triundulate, ends little capitate. Striæ radiate, 12 in 0.01 mm. Central area round. Length, 0.095 mm; breadth, 0.013. Differs from the type in its triundulate margins.

PINNULARIA ONAMURAS ap. nov. Plate 7, ag. 13.

Valve linear with attenuate ends. Strike divergent in the middle part, convergent at the ends, 11 to 12 in 0.01 mm. Length, 0.061 mm; breadth, 0.008. A species related to Pinnularia gibba var. linearis Hustedt. Named in honor of the late Prof. Dr. K. Okamura, director of the Imperial Fisheries Institute, Tokyo.

PINNULARIA BUREALIS Ebr. Plate 7, fig. 17; Plate 16, fig. 15.

Pinnularia borcalis Ehr., FR. HUSTEDT, Bacillar. (1930) 326, fig. 597.

Valve linear-elliptic with rounded ends. Striæ radiate, 5 to 7 in 0.01 mm. Length, 0.027 mm; breadth, 0.0068 to 0.009. Com-

mon on mosses, moist earth, and in Iresh water. Known from Nippon.

PINNULARIA BALPOBRIANA Grun, var. STAUROPTERA var. nov. Plate 16, Sg. U.

A minute form with radiate striæ, 9 to 10 in 0.01 mm, which form a stauros in the middle part of the valve. Length, 0.037 mm; breadth, 0.005. Rare. Differs from the type in its larger size and a stauros in the middle part of the valve.

PINNULARIA LIGNITICA Cieve, Plate 10, 62, 26.

Pinnularia lignitica CLEVE, Synopsis Navicul, Diatoms (1895) 2, 85, pl. 1, fig. 15.

A distinct species with rhombic valve, short striæ 11 to 12 in 0.01 mm, and a broad central area. Length, 0.062 mm; breadth, 0.018. Longitudinal band distinct. Common in Kizaki Lake. Reported as a fossil from Nippon lignite (Brun collections).

PINNULARIA TARELLARIA Ehr. Plate 9, \$5. 5.

Pinnularia tabellaria Ehr., A. Schmot, Atlas Diatom, pl. 43, fig. 4.

Valve linear, slightly gibbous in the middle. Striæ parallel, convergent at the ends, 10 in 0.01 mm. Axial area linear, central area elliptic. Length, 0.244 mm; breadth, 0.019. Known from North America, Brazil, Siberia, and South Africa.

PINNULARIA HUSTEDTII Meister. Plate 8, 6g. 5.

Pinnulara Hustellii Meister, Seltene und neue Kieselalgen (1934) 102, fig. 82.

Valve linear with capitate ends. Axial area linear, widened in the middle. Strice 9 in 0.01 mm. Length, 0.221 mm; breadth. 0.017. Reported only from Canton River, southern China.

PINNULARIA MAJOR (RGIL) Cleve. Plate 6, 6g. 16.

Pinnularia major (Kütz.) Cleve. FR. HUSTEDT, Bacillar. (1930) 331, 614.

Valve linear, slightly gibbons in the middle. Length, 0.161 num; breadth, 0.022. Striæ 7 in 0.01 mm. Common in fresh water. Known from Nippon.

PINNULARIA MAJOR (Kuiz.) Cleve var. LINEARIS Cleve. Plate 7, 6g. 11.

Pinnularia major (Kütz.) Cleve var. linearis Cleve, Pantocsek, Fossile Bacillarien Ungarus (1905) 3, pt. 7, fig. 113.

Valve broad-linear with parallel margins. Strim 9 in 0.01 mm. Length, 0.127 mm; breadth, 0.02. Common.

PINKULARIA VIRIDIS (Nitroch) Ehr. var. LEPTOGONGYLA (Ehr. Gran.) Clove. Plate 6. 8g. 11.

Pigunlaria leplogongula A. Schmidt, Atlas Diatom. (1876) pl. 45, figs. 26-28.

Valve linear with attenuate ends. Striw 7 to 8.5 in 0.01 more, with a distinct band. Central area broad, axial area one-third of the breadth of the valve. Known from brackish waters of Europe.

PENNULARIA VIRIDIS (Nitzerle) Ehr, vor. INTERMEDIA Cleve. Plate 7. Sp. 2.

Pintularia sp. A. Schmidt, Atlas Diatom. (1876) pl. 42, figs. 9-10.

Valve large with two longitudinal bands. Central area broad. Length, 0.105 mm; breadth, 0.017. Strike 8 to 9 in 0.01 mm. Common in fresh water.

PINNULARIA VIRIDIS (Nitzsch) Ebr. var. FALLAN Cleve. Plate 9, 5g. 7; Plate 13.

Navicula sp. A. Schmidt, Atlas Diatom. (1876) pl. 43, fig. 24; pl. 45, figs. 10-11.

Valve linear, narrowed towards the ends. Striæ 9 to 11 in 0.01 mm, without longitudinal band. Central area with a short stauros or shortened striæ. Length, 0.045 to 0.049 mm; breadth, 0.01. Common.

PINNULARIA VIRIOIS (Nitzech) Ehr. var. SUDETICA (Bilse) Rostedt. Pinte 9, 5g. 21.

Pinnularia viridis (Nitzech) Ehr. var. sudetica (Hilse) Hustedt,
Bacillar. (1930) 335, fig. 617b.

A form with coarse strize, 9 in 0.01 mm, with a longitudinal band. Axial and central areas linear. Known from fresh water in Europe.

PINNULARIA VIRIDIS (Nitisch) Ehr. vor. NIPPONICA vor. nov. Plate 6, fig. 14; Plate 8, fig. 2.

Valve lanceolate with complex median line. Striæ 6 to 7.5 in 0.01 mm. Length, 0.081 to 0.09 mm; breadth, 0.018. This new variety differs from the type in its striæ without the longitudinal band. Common in Kizaki Lake.

PINNULARIA UENO sp. nov. Plate 7, Sg. 1-

Valve boat-shaped, elliptic-lauccolate with parallel margins and obtuse, subrostrate ends. Strike robust, radiate, dilated in the middle to a transverse fascia, 9 in 0.01 mm. Median line slightly arcuate. Terminal fissures comma-shaped. Axial area somewhat dilated in the middle. Central pores distinct. Length, 0.062 mm; breadth, 0.013. Named in honor of Dr. Masujo Ueno, of Otsu, Nippon.

PINNULARIA NIPPONICA ap. nov. Plate 7, fig. 12.

Valve slightly triundulate, with truncate ends. Striæ robust, radiate, 8 in 0.01 mm. Central area a fascia. Median line flexuose. Terminal fissures comma-shaped. Axial areas linear. Length, 0.072 mm; breadth, 0.018. Uncommon.

, PINNOLARIA DACTYLUS Ehr. var. DARIANA A. S. fo. NIPPONICA fo. nov. Plate 7, 6g. 5.

Valve lanceolate with obtuse ends. Length, 0.122 mm; breadth, 0.22. Median line not complex. Axial area broad, widened in the middle part. Striæ divergent in the middle, convergent at the ends, 8 in 0.01 mm. The type form has the valve 0.18 to 0.21 mm in length with striæ, crossed by a broad band. Variety Dariana is reported from America.

PINNULARIA NOBILIS Ehr. Plate 10. Ag. 1.

Pinnalaria nobilis Ehr., Fr. Hustent, Bacillar. (1930) 337, fig. 619.

Valve linear, slightly gibbous in the middle, with rounded ends. Length, 0.204 mm; breadth, 0.03. Strike 6 in 0.01 mm. Common.

PINNULARIA HARTLEYANA Greeille. Finle 6, 6g. 5.

Planudaria Hartleyana Grevule, Descriptions of new and rare diatoms, T. M. S. 13 (1865) pl. 6, fig. 30; A. Schmidt, Atlas Diatom. (1913) pl. 33, figs. 1, 2; G. B. De Toni and E. L. Forti, Alghe di Australia, Tasmania e Nuova Zelanda (1923) 145, fig. 6.

Valve robust, undulate in the middle and on the ends. Length, 0.12 mm; breadth, 0.015. Ends cuneate. Striæ divergent in the middle, convergent at the ends, 9 in 0.01 mm. Central area a rectangular fascia. Axial area enlarged around the central nodule and expanded at the ends. The Kippon form is smaller than the type. Pinnularia Hartleyana has been reported from Liberia and Kalahari in Africa, Demorara River in South America, Wakarevareva in New Zealand, and Aokiko Lake in Nippon.

AMPHORA OVALIS Kötz, fo. GRACHIES (Ehr.) Cleve. Plate 3, 5g. 16.

Amphora sp. A. Schmot, Atlas Diatom. (1875) pl. 26, fig. 101.

Frustule elliptic. Length, 0.02 mm; breadth, 0.0085. Striæ-16 in 0.01 mm. Common in fresh water.

AMPHORA OVALIS Kūtz. var. PEDICULUS Kūtz. Piate 3, 6g. 14.

Amphora avalis Kütz, var. pedientus Kütz., Fr. Hostedt, Bacillar. (1930) 343, fig. 629,

Frustule elliptic. Valve lunate. Length, 0.012 mm; breadth, 0.0076. Striæ 18 in 0.01 mm. Common in fresh and brackish waters. Known from Nippon.

AMPHORA OVALIS Rote, var. LIBYCA (Ebr.) Cleve. Plate 3, 5g. 17.

Amphora libyco Ehr. A. SCHMIDT, Atlas Diatom. (1875) pl. 26, fig. 105.

Valve lunate. Length, 0.035 mm; breadth, 0.0068. Stria: 14 in 0.01 mm. Median line arcuate. Central area distinct, on the dorsal side frequently uniting with a blank band across the striæ. Common in fresh and brackish waters.

AMPRORA PERPUSILLA Gras. Plate 2, 5g. 12.

Amphora perpusilla Grun., FR. HUSTEUT, Bacillar. (1930) 343, fig. 627.

Frastule elliptic. Length, 0.005 mm; breadth, 0.0025. Common in Iresh water and moist earth.

AMPHORA NORMANII Rubh. Plate 3, fig. 18.

Amphora Normanii Rabh., Ph. Hustwart, Bacillar. (1930) 343, fig. 630.

Frustule elliptic, truncate. Valve narrow, lunate, and capitate. Central nodule strong. Length, 0.024 mm; breadth, 0.0034. Striæ 18 to 20 in 0.01 mm. Common in moist earth.

AMPHORA DELPHINEA (Balley) A. S. var. MINOR Cleve. Plate 5, Su., 12,

Amphora delphinea Bailey, A. Schmidt, Atlas Diaton, (1876) pl. 40. fig. 25.

Frustole elliptic-rectangular, with parallel margins. Length, 0.047 to 0.05 mm; breadth, 0.015. Valve linear with rounded ends. Central nodule dilated to a stauros. Median line arcuate. Striz almost parallel, 24 in 0.01 mm. Known from Crane Pond, North America, and from Demerara River, South America. Common in Kizaki Lake.

CYMHELLA MICROCEPHALA Grun. Plate 1L fig. 25.

Cymbella microscephata Grun., Fr. Hustrot, Bacillar. (1930) 351, fig. 637.

Valve linear with rostrate-capitate ends. Length, 0.017 mm; breadth, 0.0034. Strike very fine, 28 in 0.01 mm. Common in fresh water.

CYMBELLA ALPINA Gren. Plate 12, Se. 13.

Gymbella alpina Grue., A. Schmar, Atlas Diaton. (1931) pl. 373, fig. 17.

Valve slightly asymmetrical, lanceolate. Length, 0.049 mm; breadth, 0.01. Strike 8 in 0.01 mm. Common in alpine regions. CYMBELLA REINHARDTH Great. Plate 10, Sg. 14.

Cymbella Reinhardtii Grun., FR. HUSTEDT, Bacillar. (1930) 354, fig. 644.

Valve slightly asymmetrical, elliptic-lanceolate, with convex dorsal and ventral margins. Axial and central areas broad.

١

Length, 0.032 mm; breadth, 0.009, Striæ 15 in 0.01 mm. Known from Europe.

CYMBELLA EHRENBERGH Kütz. Plate II, fig. 1.

Cymbella Ehrenbergii Kütz., Fr. Hustent, Bacillar. (1930) 356, fig. 656.

Valve elliptic-lanceolate. Length, 0.105 mm; breadth, 0.037. Striæ 9 in 0.01 mm. Common in fresh water.

CYMBELLA NAVICULIFORMIS Auerswald. Plate 11, fig. 6.

Cymbella mavicaliformis Auerswald, Fr. Hustrot, Bacillar. (1930), 356-357, fig. 653.

Valve naviculiform, lanceolate with capitate and constricted ends. Length, 0.032 mm; breadth, 0.0085. Strize 12 in 0.01 mm. Central area circular. Common in Kizaki Lake. Known from alpine regions.

CYMBELLA CHSPIDATA REEL Plate 11, 6u. 23,

Cymbelld cospidata Kutz., A Schmitt, Atlas Diatom, (1931) pl. 374, 6gs. 13, 14,

Valve slightly asymmetrical with rostrate-capitate ends. Length, 0.034 to 0.074 mm; breadth, 0.012 to 0.02. Striæ 8 in 0.01 mm. Known from Nippon.

CYMBELLA BETEROPLEURA Ehr. var. MINOR Clave. Plate 11, 62, 4.

Cumbella sp. A. Schmar, Atlas Diatom, (1875) pl. 9, figs. 51, 52.

Valve slightly asymmetrical, lanceolate with rostrate ends. Length, 0.074 mm; breadth, 0.022. Central area large. Striæ 8 in 0.01 mm. Known from fresh waters of far-northern regions.

CYMBELLA BETEROPLEURA Ebr. fo, NIPPONICA fo. nov. Plate II, fig. 13.

Valve linear-lanceolate, attenuate, and with truncate ends. Length, 0.04 mm; breadth, 0.01. Strike 8 to 9 in 0.01 mm, not lineate. Axial area linear, central area orbicular. Differs from the type in its small valve.

CYMBELLA PROSTRATA (Berkeley) Cieve. Plate 10, 6g. 23,

Cymbella prostrata (Berkeley) Cleve, Fs. Hustedt, Bacillar. (1930) 357-358, fig. 659.

Valve asymmetrical with elevated dorsal and triundulate ventral margins. Median line arcuate with long terminal fissures. Axial area lanceolate. Striæ punctate, 7 ventral, 6 dorsal, in 0.01 mm. Common in fresh and brackish waters.

CYMBELLA TUNGIDA (Greg.) Clove. Plate 18, 6g. 29.

Cymbella turgida (Greg.) Cleve, Fr. Hustert, Bacillar. (1930) 358, 6g. 660.

Valve funate, with arcuate dorsal margin, slightly gibbous ventral margin. Length, 0.054 mm; breadth, 0.014. Striæ 6 in 0.01 mm. Known from Aokiko Lake. Common in tropical regions.

CYMBELLA VENTRICOSA Kutz. Plate 11, 6es. 8, 14, and 18.

Cymbella ventricesa Kütz., Fr. Husteot, Bacillar. (1930) 359, fig. 661.

Valve lunate with straight or slightly gibbous ventral margin. Length, 0.025 to 0.032 mm; breadth, 0.006 to 0.007. Strike 10 to 12 in 0.01 mm. Very common in fresh water.

CYMBELLA GRACILIS Rabb. Plate D. 82. 5.

Cymbella gracilis Rabh., VAN HEURCK. Synopsia (1880-1881) pl. 3, , figs. 20-21.

Valve narrow with slightly arounte dorsal, and straight ventral, margins. Length, 0.062 mm; breadth, 0.008. Striæ 12 in 0.01 mm. Found in fresh water, especially in alpine regions.

CYMBELDA GRACILIS (Rabh.) Cleve fo. MINOR fo. nov. Plate 12, fig. 22,

Like the type, but smaller. Length, 0.018 mm; breadth, 0.045. Strice 12 in 0.01 mm. Median line approximate to the ventral margin. Uncommon.

CYMBRLLA ÆQUALIS W. Smith. Plate 3, Sg. 5; Pinte 11, fig. 2.

Cymbella obtusa Greg., A. Schmidt. Atlas Diatom. (1875) pl. 9, figs. 41-45.

Valve naviculiform and subclavate. Length, 0.032 to 0.042 mm; breadth, 0.0065 to 0.009. Striæ radiate, 12 to 15 in 0.01 mm. Common in alpine regions. Known from Ackiko Lake.

CYMRELLA SINUATA Greg. Plate 11, 8g. 15.

Cymbella sinunta Greg., Fr. Hustent, Bacillar. (1930) 361, fig. 668a.

Valve linear, slightly asymmetrical, gibbous in the middle with obtuse ends. Length, 0.02 mm; breadth, 0.005. Strize 12 in 0.01 mm. Reported from Aokiko Lake.

CYMBELLA SINUATA Gree, var. ANTIQUA Gran. Plate 9, fig. (f.

Cymbella sinuata Greg, var. antiqua Grun., Pantocsek, Fossile Bacillar, Ungavas (1995) 141, pl. 29, fig. 31.

Valve linear with capitate ends. Length, 0.018 mm; breadth, 0.0068. Strike 5 to 6 in 0.01 mm. The typical variety antiqua is larger, being 0.032 to 0.033 mm in length. Known only as a fossil from Hungary.

CYMBELLA TURCIDULA Gron. Plate 11, Sg. 24,

Cymbella turgidula Grun., A. Schmior, Atlas Diatom. (1875) pl. 9, figs. 23-26.

Valve asymmetrical with rostrate and obtuse ends. Length, 0.029 mm; breadth, 0.011. Strike 9 to 10 in 0.01 mm. On the ventral side of the central nodule are two puncts. Known from the Tropics.

CYMBELLA APPINIS KEE: Plate 11, figs. 9 and 10.

Cymbella affinis Kütz., Fg. Hustept, Bacillar. (1930) 362, fig. 671.

Valve cymbiform with truncate ends. Length, 0.035 to 0.039 mm; breadth, 0.0085 to 0.012. Strice 8 to 10 in 0.01 mm. Known from Nippon.

CYMPELLA HYBRIDA Cross. Plate 5, Sg. 22.

Cymbella hybrida Grun., CLEVE, Synopsis Navicut. Diatoms (1894) 1, 166, pt. 4, 6g. 23.

Navicula rhynchocephala Kütz, var. hankensis Skvontzaw, Diatoms Hanka Lake (1929) 49, pl. 4, fig. 22.

Valve naviculiform, linear with parallel margins and truncate ends. Strim lineolate, divergent in the middle, convergent at the ends, 9 in 0.01 mm. The median strim, opposite the stigma, shortened. Axial area narrow, linear widened in the middle. Length, 0.062 mm; breadth, 0.0085. Known from fresh water and very slightly brackish water in Sweden, reported from Hanka Lake, Siberia. Common in Kizaki Lake.

UYMSZLLA JAPONICA Reichelt. Plate 10, 62, 4; Plate 11, 528, 1 and 7,

Cymbella japonica Reichelt, A. Schmior, Atlas Diatom. (1931) pl. 378, figs. 29-31.

Cymbella signata Pant, var. chineasis Skvortzow, Alpine diatoms from South China (1929) 46, pl. 2, fig. 21.

Valve sublinear, subclavate with attenuate, rounded ends. Length, 0.042 to 0.08 mm; breadth, 0.012 to 0.014. Striæ robust, slightly radiate, 6.5 to 8 in 0.01 mm, distinctly lineolate. Median line arcuate, broad with reflexed terminal fissures. Near the central nodule one stigma. Known from Yokobama on mosses, in Ackiko Lake, and common in Kizaki Lake. Reported from a mountain stream near Foochow, southern China.

CYMBEULA CYMBIFORMIS (Agardh, Köta) Van Heurek. Plate 11, 6g. 21.

Cymbella cymbiformis (Agardh, Kütz.) Van Heurek, Fu. Hustent, Baeillar. (1930) 362, fig. 672.

Valve hoat-shaped, with slightly gibbous ventral margin and obtuse, truncate ends. Length, 0.051 to 0.076 mm; breadth,

496----4

٢

0.0085 to 0.015. Striæ 7 to 10 in 0.01 mm. At the ventral side of the central nodule a distinct isolated punctum. Common in fresh water. Known from Nippon.

CYMBELLA CISTELA (Hemprich) Grun. Plate 3, Sg. 20.

Combella cistula (Hemp.) Grun., VAN HEURCK, Synopsis (1880-1881) pl. 2, fig. 2.

Valve cymbiform. Length, 0.059 to 0.093 mm; breadth, 0.013 to 0.017. On ventral side one or two isolated puncta. Common in Iresh water.

CYMBELLA ASPERA (Ehr.) Cleve var. TRINCATA (Rabb.) Dippel. Plate 9, 5g. 19.

Cymbrile gastroides var. truncatu (Rabb.) Dippel, A. MAYER, Die

Bacillar, d. Regensburger Gewässer (1913) 262, pl. 13, 6g. 20.

Valve symbiform with truncate ends. Length, 0.13 mm; breadth, 0.025. Strise 8 in 0.01 mm. Common.

CYMPRICIA TUMBBA (Rich.) Van Heurek. Plate II, fig. 17.

Cymbella tumida (Breb.) Van Heurek, Fs. Hustent, Bacillar. (1930) 366, fig. 677.

Valve boat-shaped with rostrate-truncate ends. Length, 0.057 mm; breadth, 0.017. Strike 9 in 0.01 mm. Reported from Nippon.

CYMBELLA TUMDA (Breb.) Van Beurek var. BOREALIS Grun. Plate 11, 2g. 16.

Cymbella tumida (Breb.) Van Heurek var. borealis Grun., Skvortzow,

Diatoms of Hanka Lake (1929) pl. 7, fig. 3.

Valve cymbiform and truncate. Length, 0.085 mm; breadth, 0.017. Striæ 8 in 0.01 mm. Common in fresh water.

CYMBELLA RAWAMURAS sp. nov. Plate 15, fig. 10.

Valve naviculiform, lanceolate, with attenuate and capitate ends. Strice strong, radiate, not stricte, in the middle of unequal length, 12 in 0.01 mm. Axial area very narrow, central elliptical with two isolated puncta. Length, 0.027 mm; breadth, 0.009. A distinct species, named in honor of Prof. Dr. T. Kawamura, of Kyoto, Nippon.

COMPHONEMA VASTUM Bustedt. Plate 15, fig. 5.

Gamphonema rastron Hustert, Bacillar, a. d. Ankikosee in Japan 166, pl. 5, fig. 4.

Valve clavate with slightly capitate apex and narrow base. Length, 0.028 mm; breadth, 0.006. Striæ short, marginal, 12 in 0.01 mm. Axial area broad. Central area with one isolated punctum. Reported only from Ackiko Lake, Nippon.

١,

COMPHONEMA VASTUM Bustedt var. CUNEATA var. nov. Plate 10, dg. 11,

Valve with cuneate apex. Length, 0.039 mm; breadth, 0.005. Strize 15 in 0.01 mm.

Valve with clongate apex. Length, 0.028 to 0.034 mm; breadth, 0.005 to 0.006. Strike 12 to 17 in 0.01 mm. Common in Kizaki Lake.

COMPHONEMA ACCUMINATUM Ehr. Place 13, 6g. 39.

Gomphonema asumbiatum Ehr., Fr. Hustent, Bacillar, (1930) 370, fig. 683.

Valve clavate and biconstricted. Strize 10 to 11 in 0.01 mm. Length, 0.034 mm; breadth, 0.085. Common in fresh water.

GOMPHONEMA ACUMINATUM Ehr. ver. TURRIS (Ehr.) Cleve. Plate 1z, ag. 4.

Gemphonema acuminatum Ehr. var. turris (Ehr.) Cleve, A. Schmidt, Atlas Diatom. (1902) pl. 239, figs. 34-36.

Valve slightly biconstricted. Striæ 16 to 18 in 0.01 mm. Length, 0.047 mm; breadth, 0.085. Common in fresh water. Rare in Kizaki Lake.

GOMPHONEMA ACUMINATUM Eds. var. CORONATA (Eds.) W. Smith. Plate 12, aa. 8. Gomphonema acuminatum Edr. var. coronata (Edr.) W. Smith, Fr. Hustent, Bacillat. (1930) 370, fig. 684.

Valve slightly biconstricted, elongate. Length, 0.069 mm; breadth, 0.01. Rare in Kizaki Lake.

GOMPHONEMA PARVULUM (NORL) Grop. Plate 12, figs. 16 and 34.

Gemphonema parvulum (Kütz.) Grun., A. Schmidt, Atlas Diatom. (1992) pl. 234, fig. 14.

Valve elliptic-clavate with capitate ends. Length, 0.02 mm; breadth, 0.0065. Strise 14 to 15 in 0.01 mm. Common in fresh water.

GOMPHONEMA PARYULUM (Köte.) Gran. var. EXILISSIMA Gran. Plate 13. 5z. 21.

Gomphonema parvulum (Kütz.) Grun. var. exilissima Grun., Van Heurek, Synopsis (1880-1881) pl. 25, 6g. 12.

Valve narrow, lanceolate. Length, 0.017 mm; breadth, 0.0042. Striæ 15 in 0.01 mm. Uncommon.

GOMPHONEMA PARVULUM (Kötz.) Gran. vor. MICROPUS (Kütz.) Cleve. Plate 13. ng. 3.

Gomphonema parvulum (Kütz.) Grun. var. micropus (Kütz.) Gleve, Fr. Hustent. Bacillar. (1930) 373, fig. 713c.

Valve slightly clavate with obtuse apex. Length, 0.011 mm; breadth, 0.005. Striæ 15 in 0.01 mm.

GOMPHONEMA PARVULUM (Kütz.) Grun, var. MICROPUS (Kütz.) Cleve fo, NEPPONICA fo, nov. Plate 12, Og. 36.

Valve minute, subovate with obtuse apex. Length, 0.009 mm; breadth, 0.0029. Strike 18 in 0.01 mm. Isolated puncta indistinct. Differs from variety micropus in its closer strike and smaller size.

GOMPHONEMA LANCEOLATUM Ehr. var. INSIGNIS (Greg.) Cleve. Plate 12. fig. 7: Plate 13, fig. 22.

Gomphonema lanccolatum Ehr. var. insignis (Greg.) Cleve, Fa. Hustenr, Bacillar. (1930) 376, Ag. 701.

Valve lanceolate, clavate, apex acuminate, slightly cuneate. Length, 0.04 to 0.06 mm; breadth, 0.0085 to 0.015. Strize 8 to 9 in 0.01 mm. Common in fresh water.

GOMPHONEMA AUGUR Ehr. Plate 13, 6g. 21.

Gomphonema augur Ehr., FR. HUSTEDT, Bacitlar. (1930) 372, fig. 688.

Valve clavate with broad, truncate-apiculate apex. Length, 0.051 mm; breadth, 0.02. Strice 10 in 0.01 mm. Uncommon in Kizaki Lake.

COMPRONEMA AUGUR Ehr, vor. GAUTIERI Van Heurek,

Gomphonema augur Ehr. var. Gautieri Van Heurek, FR. HUSTEDT, Bachllar. (1930) 372, 6g, 689.

Like the type, but with longer valve. Length, 0.051 mm; breadth, 0.01. Common in Kizaki Lake.

ROMPHONEMA QUADRIPUNCTATUM (Oesir.) Wishouth var. HASTATA Wishouth. Plate 10, 8g. 31.

Gomphonema quadripunctatus (Oestr.) Wislouch var. kastuta Wis-Louch, Neue Untersuchungen fiber d. Diatomeen des Baikal-Sees (1924) 166-167, figs. a-c.

Valve clavate with attenuate and broad apex. Length, 0.044 mm; breadth, 0.009. Strike radiate, 11 to 13 in 0.01 mm. Central area a broad fascia with four isolated puncta. Median line straight, with long terminal fissures. Rare. Reported from northern Europe, Baikal Lake, Manchurian Mongolia.

COMPRONEMA SUBTILE Ehr. vac. SAGITTA Schumano, Plate 10, fig. 12.

Gemphonema subtile Ehr. var. sayitta Schumann, A. Schmitt, Atlas Dietom, (1903) pl. 236, fig. 13.

Valve clavate with slightly capitate apex and narrow base. Length, 0.028 nm; breadth, 0.0034. Strice 11 in 0.01 mm. Axial area linear. Known from Europe.

GOMPHONEMA LINGULATUM Hustedt. Plate 13, dgs. 6 and 7.

Gomphanema lingulatum Hustent, Bacillar, a. d. Aokikosce in Japan 166-167, pl. 5, fig. 5. Valve clavate with broad, truncate, apiculate apex and narrow base. Length, 0.023 to 0.03 mm; breadth, 0.0068 to 0.008. Striæ marginal, 15 in 0.01 mm. No isolated punctum. Known only from Ackiko Lake, Nippon.

GOMPHONEMA OLIVACEUM (Lyngb.) Kūtz. Plate 13, 6g. 22.

Gomphouema olivaceum (Lyngb.) Kütz., Fn. Hustedt, Bacillar. (1930) 378, fig. 719.

Valve subclavate with broad, obtuse apex. Length, 0.024 mm; breadth, 0.006. Striæ 15 in 0.01 mm. Common in fresh water.

GOMPHONEMA OLIVACEUM (Lyngh.) Kött, vor. MINCTISSIMA Hastedt, Plate 13, Br. 39.

Gomphonema olivaceum (Lyngb.) Kütz, var. minutissima Hustror, Bacillar, (1930) 378-379, fig. 720.

Like the type, but smaller. Length, 0.01 mm; breadth, 0.004. Strize 15 in 0.01 mm. Uncommon.

GOMPHONEMA GRACILE Eds. vas. L'ANCEOLATA (Ediz.) Cleve. Plate 10, fig. \$.

Gomphinema gracile Ehr, var. lanccolata (Kütz.) Cleve, A. Saнмют, Atlas Diatom. (1903) pl. 236, figs. 26-28.

Valve lanceolate-clavate, with apiculate apex. Length, 0.035 mm; breadth, 0.0065. Striæ 15 in 0.01 mm. In fresh water, common in the Tropics.

GOMPHONEMA ABBREVIATUM Agestab? Katt. Plate 13, 6g. 42,

Gomphonema abbreviatum Agardh? Kütz., Fr. Hustrert, Bacillar. (1930) 379, fig. 722.

Valve clavate with broad ends. Length 0.017 mm; breadth, 0.0034. Strix marginal, 15 in 0.01 mm. Axial and central areas uniting in a broad linear-lanceolate space. Reported from fresh and brackish waters.

COMPRONEMA INTRICATUM EQU. Piete 13, figs. 14 and 41.

Gomphonema intricatum Kütz., A. Schmidt, Atlas Diatom. (1963) pl. 235, figs. 16-17.

Valve sublinear, slightly gibbous in the middle with obtuse apex and base. Length, 0.035 to 0.044 mm; breadth, 0.0056 to 0.0085. Striæ 12 in 0.01 mm. Common in fresh water.

COMPHONEMA CONSTRUCTUM Ehr. Plate 13, figs. 13 and 20.

Gomphonoma constriction Ehr., FR. Hustrut, Bacillar. (1930) 377, fig. 714.

Valve clavate, biconstricted with rounded, truncate apex. Length, 0.039 to 0.044 mm; breadth, 0.01 to 0.014. Striæ 9 to 10 in 0.01 mm. Common in fresh water. COMPRONEMA CONSTRICTUM Ehr. var. CAPITATA (Ehr.) Clere, 'Plate 13, Sc. 23.

Gemphonema constrictum Ehr. var. capitata (Ehr.) Cleve, Fr. Mus-Teor, Bacillar. (1930) 377, fig. 715.

Valve clavate with broad, truncate ends. Length, 0.03 to 0.089 mm; breadth, 0.006 to 0.0085. Strike 12 in 0.01 mm. Common in Kizaki Lake.

COMPRONEMA DERGGRENII Cleve, Plate 12, fig. 16.

Gomphonema Berggrenii CLEVE, Synopsis Navicul, Diatoms (1894) 1, 185, pl. 5, figs. 6, 7; A. SCHMIDT, Atlas Diatom, (1903) pl. 240, figs. 26-30.

Valve clavate with broad subtruncate apex. Base clongate, narrow. Length, 0.044 mm; breadth, 0.0085. Axial area with an isolated punctum. The median stria opposite to the isolated punctum is shortened. Only known from fresh water in New Zealand.

GOMPHONEMA NIPPONICA sp. nov. Plate 12, Sg. 3; Plate 13, Sg. 24.

Valve elongate, clavate with subtruncate and constricted apex. Ends long, attenuate, obtuse. Length, 0.056 to 0.06 mm; breadth, 0.0085 to 0.01. Striæ robust, 9 in 0.01 mm. Axial area narrow, narrowed to the middle, unilateral. Central area unilateral, opposite to the stigma a broad stauros. Not common in Kizaki Lake. Gomphonoma bohemicum Reichelt and Fricke and G. dubia Meister are nearly related to this new species.

EP)TijiEMIA CISTULA (Ehr.) var. LUNARIS Gron. Plate 9. fig. 12.

Epithemia cistuta (Ehr.) var. henaris Grunow, Beiträge zur Kenntniss der fossilen Diatomeen Osterreich-Ungarns (1903) 137-138, pl. 29, figs. 1, 2.

Epithemia hyndmannii W. Smith var. chinensis Suvortzow, Alpine Diatoms from South China (1929) 46, pl. 2, figs. 22, 23; pl. 2, fig. 9.

Valve lunate, gibbous on the dorsal side. Ends long, obtuse. Length, 0.057 to 0.06 mm; breadth, 0.011 to 0.014. Costæ 3, striæ 15, in 0.01 mm. Reported from fresh water in Bengal, India, from Foochow, southern China, and as a fossil from Dubravica, Hungary.

EPITHESHA ZEBRA (Ehr.) Kuta.

Epithomia zobra (Ehr.) Kätz., Fr. Hustror, Bacillar. (1930) 384-385, fig. 729.

Valve linear with straight ventral side. Length, 0.085 mm; breadth, 0.01. Costæ 4, striæ 15, in 0.01 mm. Known from Aokiko Lake.

EPITHEMIA ZEBRA (Ehr.) Ruiz. *zr. SANONICA (Kütz.) Grun. Plate 10, fig. 21.

Epithomia schra (Ehr.) Kütz. var. saxonica (Kütz.) Grun., Fr. Hostedt, Bacillar. (1930) 385, fig. 730.

Valve linear, curved. The obtuse ends are slightly turned downwards. Length, 0.034 mm; breadth, 0.01. Striæ 13 to 14 in 0.01 mm. Not common in Kizaki Lake.

EPITHEMIA SOREX KEGA. Plate 15, Rg. 12.

Epithemia sorex Kütz., Fr. Hustent, Bacillar. (1930) 288, fig. 736. Valve broad, gibbous on the dorsal side, slightly curved on the ventral side. Length, 0.025 mm; breadth, 0.008. Common in fresh and brackish waters. Reported from Aokiko Lake, Nippon.

RHOPALODIA CIBBA (Ebr.) O. Moll. Plate 9, \$2, 2.

Rhopalodia gibba (Ehr.) O. Mull., Fr. HUSTEDT, Bacillar. (1930) 390, fig. 740.

Valve linear, arcuate, straight on the ventral side, reflexed at the extremities. Costæ 6 in 0.01 mm. Length, 0.111 mm; breadth, 0.0085. Common in Kizaki Lake.

RHOPALODIA CHREERGLA (Ebr.) O. Mall. Plate 8, 5g. 12.

Rhopalodia gibbarda (Ehr.) O. Mull., Fr. Hustent, Bacillac. (1900) 391, fig. 742.

Valve gibbous in the middle of the dorsal side and straight on ventral side. Length, 0.045 mm; breadth, 0.022. A species of brackish waters. Not common in Kizaki Lake.

REOPALODIA PARALLELA (Grun.) O. Mull. Plate S. Sg. 7: Plate S. Sg. 11.

Rhopalodia parallela (Grun.) O. Moll., Fr. Hustrat, Bacillar, (1930) 389-390, fig. 739.

Valve linear with parallel margins. Length, 0.062 to 0.2 mm; breadth, 0.018 to 0.03. Costæ 5 to 6 in 0.01 mm. Striæ 16 in 0.01 mm. An alpine species, known from many parts of the world.

NITZSCHIA FONTICOLA Gran. Plate 13, fig. 35.

Nitzschia fonticola Grun., FR. Hustrot, Bacillar. (1930) 415, fig. 800.

Valve lanceolate with obtuse ends. Longth, 0.01 mm; breadth, 0.0034. Costæ 12, striæ 24, in 0.01 mm. Not common in Kizaki Lake.

NITZSCHIA SIGMOIDEA (Ehr.) W. Smith. Plate 10, fig. 2.

Niteschia sigmoiden (Ehr.) W. Smith, FR. HUSTEDT, Bacillar. (1930) 419, fig. 810.

Valve sigmoid with parallel margins. Length, 0.34 to 0.33 mm; breadth, 0.01. This is the largest *Nitzschiu* species in Kizaki Lake. Known from Aokiko Lake.

NITZSCHIA INTERRUPTA (Reichelt) Hostedt. Plato 13, fig. L.

Nitzschia moissacensis var. Heideni Mrister, in Beiträge zur Bucillar. Japans (1914) 229, pl. 8, fig. 10.

Niteschia (moissacensis Herib. var.?) Heideni Meister, A. Sommor, Atlas Diatoro, (1924) pl. 251, figs. 3-13.

Nitaschia denticula Grun., Diatom. Vega-Exped. (1883) 492, pl. 37, fig. 68.

Denticula interruptu Reichelt, Kunze, Revisio 3, 302, fig.

Valve lanceolate with attenuate and slightly capitate ends. Costae long, irregularly disposed, 5 in 0.01 mm. Striæ robust, elongate, 14 to 15 in 0.01 mm. Length, 0.03 to 0.035 mm; breadth, 0.0068 to 0.007. Common in Kizaki Lake. Reported from Aokiko Lake.

NITZSCRIA PALKA (KB(k.) W. Smith. Plate 13, figs. 15 and 28.

Nitzschia palca (Kütz.) W. Smith, Fr. Rustent, Bacillar. (1930) 416, . fig. 801.

Valve linear-lanceolate with attenuate ends. Length, 0.029 to 0.032 mm; breadth, 0.0025 to 0.0042. Cosiæ 11 to 12 in 0.01 mm. Striæ very fine, about 35 in 0.01 mm. Common in Kizaki Lake.

NITZSCHIA PALEA (Kūte.) W. Smith var. TENDIROSTRIS Gron. Plate 13, 02, 2,

Nitzschia pulca (Kütz.) W. Smith var. tennirostris Grun., Skvontzow, Diatom recoltees par le Pere E. Licent (1935) 43, pl. 9, fig. 40.

Valve linear-lanceolate, slightly constricted in the middle part. Ends slightly capitate. Length, 0.037 mm; breadth, 0.0042. Costæ 10 to 11 in 0.01 mm. Striæ 35 in 0.01 mm. Not common.

NITZSCHIA DISSIPATA (RGiz.) Gran. Plate 13, Ogs. 17, 15, and 26.

Nitzschia dissipata (Kütz.) Grun., A. Schmidt, Atlas Diatom. (1921) pl. 332, fig. 23.

Valve linear-lanceolate with attenuate ends. Length, 0.02 to 0.057 mm; breadth, 0.0034 to 0.051. Costæ 7 in 0.01 mm. Striæ very fine, indistinct. Common in Kizaki Lake.

NITZSCHIA REGTA Hantzsch. Plate 13, fig. 25,

Nitzschia recta Huntzsch, Fr. Hustent, Bacillar. (1930) 411, fig. 785.

Valve linear with truncate, obtuse ends. Length, 0.093 to 0.098 mm; breadth, 0.005 to 0.006. Costæ 5 to 6 in 0.01 mm. Striæ indistinct. Common in fresh water.

NITZSCHIA COMMUNIS Rabenh. Plate 13, 6g. 15.

Nitaschia communis Rabenh., Fr. Hustent, Bacillat. (1930) 417, fig. 798.

Vaive broad-lanceolate with obtuse ends. Length, 0.014 mm; breadth, 0.0034. Costa 12 in 0.01 mm. Strike very indistinct. Common in fresh water.

NITZSCHIA CAPITEULATA Hustedi var. NIPPONICA var. nov. Plate 13, fig. 30.

Valve linear-lanceolate, constricted and rostrate-capitate. Length, 0.072 mm; breadth, 0.005. Costæ 7, striæ 30, in 0.01 mm. Differs from the type in its constricted valve and the different number of costæ.

NITZSCRIA VITREA Norman? Plate 15, 6g. 29.

Nitzschia vitrea Norman, A. Schmidt, Atlas Diatom. (1921) pl. 384, figs. 16, 17.

Valve lanceolate, attenuate, and subrostrate. Length, 0.045 mm; breadth, 0.006. Coste long, 8 in 0.01 mm. Strice 18 in 0.01 mm. The Nippon form differs from the type in its short valve. A fresh-water species.

NITZSCRIA ACICULARIS W. Smith var. NIPPONICA var. nov. Plate 13, 8g. 21.

Valve lanceolate with long horns or heaks. Length, 0.054 to 0.068 mm; breadth, 0.002 to 0.0025. Valve hyaline without striæ. Common in Kizaki Lake.

HANTZSCHIA AMPHIOXYS (Ehr.) Grap. Plate 13, Sg. II.

Hantzechia amphiexys (Ehr.) Grun., Fr. Hustedt, Bacillar. (1930) 394, fig. 747.

Valve lanceolate, constricted at one side, convex from the other. Ends truncate, slightly curved. Length, 0.032 mm; breadth, 0.006. Costæ 8 to 9, striæ 18, in 0.01 mm. Common in Kizaki Lake.

HANTZSCHIA ELONGATA (Honez.) Grau. Plate 8, 6g. 3.

Hantzschia elongala (Hantz.) Grun., FR. HUSTEPT, Bacillar. (1930) 395, fig. 751.

Valve linear-lanceolate, attenuate towards the ends. Length, 0.195 mm; breadth, 0.01. Costæ 5, striæ 15, in 0.01 mm. Not common in Kizaki Lake.

CYMATOPLEURA SOLEA (Breb.) W. Smith var. GRACILIS Grun. Plate 15, fig. 6.

Cymatoplewa solca (Breb.) W. Smith var. genedis Grun., Fr. Husrept, Bacillar. (1930) 423.

Valve linear, constricted in the middle, panduriform, cuneate at both ends. Length, 0.127 to 0.13 mm; breadth, 0.018 to 0.019. Reported from Aokiko Lake, Nippon.

CYMATOPLEURA SOLEA (1866). W. Smith var. RECULA (Ehr.) Gron. Plate 15, 65, 7.

Cymatopleura solea (Breb.) W. Smith var. regula (Ehr.) Grun., FR.

HESTEDT, Bueillar. (1930) 426, fig. 823b.

Valve linear, not constricted. Length, 0.062 mm; breadth, 0.001. Rare.

CYMATOPLEURA ELLIPTICA (fireb.) W. Smith. Plate 14. 6g. 1.

Cymatopleura citiptica (Breb.) W. Smith, Fr. Hustedt, Bucillar. (1930) 426, fig. 825.

Valve broad-elliptic, cuncate. Length, 0.111 to 0.15 mm; breadth, 0.05 to 0.052. Common in Kizaki Lake.

SURIRELLA BISERIATA Brob. Plate 14, fig. 12,

Surirella biscriata Breb., FR. HUSTEDT, Bacillar. (1930) 432, fig. 831.

Valve lanceolate with acute ends. Costæ reaching the median line, 2 in 0.01 mm. Long diameter, 0.142 mm; short diameter, 0.024. Common. Known from Aokiko Lake.

SURRELLA BISERIATA Breb. fo. PUNCTATA Melaler.

Surirella biscriata Breb. fo. punctata Meister, Fr. Hustedt, Bacillar. (1930) 433.

A form covered with puncta. Long diameter, 0.17 mm; short diameter, 0.032. Costie 2 in 0.01 mm. Not common. Reported from Europe.

SURGRELLA BISERIATA Breit, var. NIPPONICA var. nov. Plate 14, fig. 11.

Valve elongate-lanceolate with acute ends. Costæ 2 to 3 in 0.01 mm. Long diameter, 0.2 to 0.23 mm; short diameter, 0.028 to 0.03. Differs from the type in its longer valve. Surirella Engleri O. Mull. var. hankensis Skvortzow z seems to be related to the above species. Common in Kizaki Lake,

SURIRELLA BISERIATA Birb. var. NIPPONICA to, PUNCTATA fo, nov. Plate 15, fig. 5,

Valve punctate. Long diameter, 0.25 mm; short diameter, 0.027. Costæ 2 in 0.01 mm. Not common.

SURIRELLA BISERIATA Breb. var. CONSTRICTA Gran. fo. PUNCTATA fo. nov. Plate 11. dg. 14.

Valve constricted, acute and punctate. Median line linear. Long diameter, 0.12 mm; short diameter, 0.022. Known from Europe.

Diatoms of Hanka Lake (1929) 37, pl. 8, fig. 3.

SURIRELIA BISERIÁTA Brob. var. BIFRONS (Ehr.) Hastedl fo, BISPIDA fo. nov. Plate 15, dg. 1.

Valve short-elliptic with acute ends, irregularly covered with horns. Long diameter, 0.102 mm; short diameter, 0.047. The variety bifrons was reported from Aokiko Lake.

SURRELLA ROBUSTA Khr. fo. LATA Hestedt. Plate 16, 6g, 10,

Surirella robusta Ehr. fo. lata Hustert, Bacillar, aus dem Ackikosce in Japan 170, fig. 1.

Valve ovate with one end much broader than the other. Costæ short, 1.5 to 2 in 0.01 mm, not reaching the pseudoraphe. Marginal keel forming wings in the middle part of the costæ. Pseudoraphe lanceolate. Polar areas large. Long diameter, 0.072 mm; short diameter, 0.03. Reported only from Nippon. Common in Kizaki Lake.

SURRELLA ROBBISTA Ehr. var. SPLENBIDA (Ehr.) Van Bruzch. Plate 14, 6g. 5.

Surirella robusta Ehr. var. splendida (Ehr.) Van Heurek, Fr. Husteur. Bacillar. (1930) 437, figs. 851-852.

Valve narrow ovate, rounded at one end and acute at the other. Costre not reaching the median area. Long diameter, 0.093 to 0.136 mm; short diameter, 0.025 to 0.047. Common. Reported from Aokiko Lake.

SURRELLA ROBUSTA Phr. var. SPLENDIDA (Ehr.) Van Heurek fo. HUSTEDTIANA (Mayer) Hustedt.

Surirella robusta Ehr. var. splendida (Ehr.) Van Heurek fo. Hustedtiana (Mayer) Hustmor, Baeillar. (1930) 438.

Valve elliptic-lanceolate with acute ends. Costæ not reaching the median area, parallel in the middle, radiate at the ends. Long diameter, 0.115 mm; short diameter, 0.037. Costæ 2 in 0.01 mm. Known from Europe.

SCHREELLA ROBUSTA Ehr. var. SPLENDIDA (Ehr.) Van Heurek fo. PUNCTATA Hostest. Plate 16, fly. 2.

Surircila robusta Ehr. var. splendida (Ehr.) Van Heurek fo. punctata Hestept, Bacillar. (1930) 437.

Valve with attenuate, rounded ends. Punctate between the costæ. Long diameter, 0.111 mm; short diameter, 0.037. Costæ 1 to 1.5 in 0.01 mm. Known from Europe.

SURIBELLA ROBUSTA EM. var. SPLENDIDA (Chr.) Van Hourek fo. CONSTRICTA Husteet. Plate 16, 6g. I.

Surirella robusta Ehr. var. splendida (Ehr.) Van Heurek fo. constricta Hustent, Bacillar. (1930) 437.

Valve constricted. Long diameter, 0.153 mm; short diameter, 0.037. Rare.

SURGELLA LINEARIS W. Smith. Plate 15, Sr. 11.

Surirella linearie W. Smith, Fr. Hustept, Bacillar, (1930) 434, fig. 837.

Valve linear with concate ends. Alæ and costæ distinct. Median line linear. Long diameter, 0.042 mm; short diameter, 0.01. Costæ 2.5 in 0.01 mm. Reported from Aokiko Lake.

SHRIRELLA LINEARIS W. Smith var. CONSTRICTA (Ehr.) Green. Plate 14, Sg. 7.

Surfiella linearis W. Smith var. constricta (Ehr.) Grun., Fr. HUSTEDT. Bacillar. (1980) 434, fig. 839.

Valve constricted. Long diameter, 0.072 mm; short diameter, 0.013. Costa 2 in 0.01 mm. Found in Ackiko Lake, Nippon.

SURFRELLA LINEARIS W. Smith var. HELVETICA (Brun) Meister. Plate 16, fig. 5.

Sprirella linearis W. Smith var. kelvetica (Brun) Meister, Fa. Itusrear, Bacillar. (1930) 434, fig. 840.

Valve linear with parallel margins, cuneate and punctate. Long diameter, 0.119 mm; short diameter, 0.034. Costa 1.5 in 0.01 mm. Also reported from Aokiko Lake, Nippon.

SURRELLA LINEARIS W. Smith var. MIPPONICA var. nov. Plate 19, 2g. 9.

Valve linear with subcuneate ends, punctate. Outer rim robust. Marginal keel or alæ distinct. Costæ parallel, 2.5 to 3 in 0.01 mm. Median line linear. Long diameter, 0.052 mm; short diameter, 0.014. Variety nipponica is closely connected with variety helvetica.

SURIRELLA UNEARIS W. Smith vor. NIPPONICA fo. CONSTRICTA fo. nov. Plate 18.

Valve constricted with attenuate and cuneate ends, punctate. Median line linear. Long diameter, 0.064 mm; short diameter, 0.01 to 0.012. Costæ 3 in 0.01 mm. Not common.

SURRELLA LINEARIS W. Smith var. APICULATA var. nov. Plate 16, fig. 3.

Valve linear, slightly constricted with subrostrate ends. Costæ parallel, 3 in 0.01 mm, reaching the median line. Long diameter, 0.076 mm; short diameter, 0.014.

SURIRELLA CAPRONII Breb. var. ORTUSA Hostedt. Plate 14, dg. 5.

Surirella Capronii Breb. var. obtusa Husteot, Bacillar. a. d. Ackikosce in Japan 170, fig. 2.

Valve elongate-ovate with one end much broader than the other. Ends obtuse. Outer rim robust. Area distinct and robust. Costa not reaching the median area. On both ends of the median area two opposite horns. Polar area distinct. Long diameter, 0.136 mm; short diameter, 0.047. Known only from Aokiko and Kizaki Lakes.

SURTRELLA CAPRONII Breb, var. OBTRISA Bustedt fo. CAPITATA fo. nov. Plate 16. Bg. 4.

Valve slightly constricted, one end very broad. Alæ and costæ robust, 1 in 0.01 mm. Long diameter, 0.156 mm; short diameter, 0.051.

SURTRELLA ELECANS Ehr. fo. ELONGATA fo. nor. Plate 15, 5m. 4.

Valve linear with one end much broader than the other. Costæ parallel, radiate at the ends, not reaching the median line. Long diameter, 0.215 mm; short diameter, 0.044. Costæ 2 in 0.01 mm. Differs from the type in its more elongate valves.

SUBIRELLA TENERA Gregory, Pioto 14, 6g. 43.

Surirella tenera Gregory, Fr. Hustent, Bacillac. (1930) 438, fig. 853.

Valve clongate-ovate, rounded at one end and acute at the other. Outer rim narrow, smooth. Marginal alse distinct. Costa reaching the pseudoraphe, parallel in the middle, radiate at the ends. Long diameter, 0.138 to 0.14 mm; short diameter, 0.035. Common in fresh water. Not common in Kizaki Lake.

SURRELLA TENERA Gregory var. PUNCTATA var. nov. Plate 12, fig. 14.

Punctate between the costs: Long diameter, 0.136 mm; short diameter, 0.04. Uncommon.

SURIRELLA TENERA Gregory var. NERVOSA A. Schmidt. Pinte II. fig. 15.

Surirella tancra Gregory var. nervosa A. Schmidt, Fs. Hustmor, Bucillar. (1930) 439, figs. 854-855.

Differs from the type in the median line being ornamented with a horn. Long diameter, 0.114 mm; short diameter, 0.034. Costs: 2 in 0.01 mm. Uncommon.

SURIRELLA TERRYANA Ward. Plate 16. 6g. 11.

Surirella Terryana Ward, A. SCHMOT, Atlas Diatom. (1912) pl. 280, figs. 7-8.

Valve linear with obtuse ends, margins parallel or slightly constricted in the middle. Outer rim narrow, finely crossbarred.

Costæ or ribs reaching the pseudoraphe, 3 in 0.01 mm, parallel in the middle, slightly radiate at the ends. Between the costæ are fine, closely set, parallel lines. Common in Kizaki and Aokiko Lakes. Known from North and South America only. Surirella Chachinæ Skvortzow^a is closely connected with Surirella Terryana.

SURIBELLA TERRYANA Ward to. MINUTA to. nov. Plate 10. 0g. 24; Plate 13. 0g. 13. Valve linear with parallel margins or slightly constricted, with rounded or cuncate ends. Costar not reaching the pseudoraphe, 3 in 0.01 mm. Central area linear, extending the length of the valve. Long diameter, 0.037 to 0.04 mm; short diameter, 0.008 to 0.009. Strike indistinct. Common.

SUBIRELLA TERRYANA Ward var. MIPPONICA var. nov. Plate 15, 8g. 2.

Valve linear, constricted, with cuneate long ends. Outer rim narrow, finely crossbarred. Costæ or ribs 2 in 0.01 mm, slightly curved, reaching the pseudoraphe. Striæ distinct. Long diameter, 0.124 to 0.13 mm; short diameter, in the middle part 0.014, at the ends 0.019. Uncommon.

SURIRELLA OVALIS Breb. var. NIPPONICA var. nov. Plate 13, fig. 4.

Valve ovate with outer rim robust, crossbarred. Costæ short, 2 in 0.01 mm, not reaching the median area. Between the costæ are fine, closely set, parallel lines. Median area is bounded by a closely set row of transverse lines, 18 in 0.01 mm. Long diameter, 0.098 mm; short diameter, 0.042. Variety nipponica differs from the type in its set row of transverse lines around the median area. Surirella ovalis is known as a brackish-water diatom.

SURIRELIA ANGUSTATA Ruiz. Plate 3, 6g. 15.

Surirella augustata Kütz., FR. HUSTEDT, Bacillar. (1930) 435, figs. 844-845.

A minute species common in fresh water. Valve linear with cuneate ends. Costæ reaching the pseudoraphe, about 6 in 0.01 mm, parallel in the middle, radiate at the ends. Long diameter, 0.034 mm; short diameter, 0.011.

SURIRELLA PANTOCSEKII Meister. Plate 5, fig. 6.

Surirella Pantocschii Meisten, Beiträge zur Bueillar, Japans (1914) 230, pl. 8, figs. 14, 15.

Valve long-linear with panduriform rounded ends. Outer rim narrow, finely crossbarred. Costæ thin, short, parallel in the

³ Diatoms from Hanka Lake (1929) 40, pl. 8, fig. 20.

middle, radiate at the ends with intercostal striæ. Central area narrow. Long diameter, 0.102 to 0.108 mm; short diameter, in the middle part 0.01, at the ends 0.013. Five fine costæ in 0.01 mm. Reported as occurring near Yokohama, Nippon. Known from Amur and Sungari Rivers, Manchuria. Surirella tiensinensis Skvortzow, from Tientsin, northern China, and from Hanka Lake, Siberia, differs from S. Pantocsekii only in its obtuse ends and smaller size.

SURIRELLA NIPPONICA sp. nov. Plate 8, fig. 17.

Valve lanceolate with attenuate ends. Costæ short, radiate, about 2 in 0.01 mm. Striæ distinct. Median area broad. Differs from Surirella delicatissima Lewis * in its broader valve and wider costæ.

STENOPTEROBIA INTERMEDIA (Lewis) fo. SUBACUTA Fricke. Plate 10, fig. 50.

Stenoplevobia intermedia (Lewis) fo. subacuta Fricke, A. Schmot, Atlas Diatom. (1912) pl. 284, fig. 6.

Valve sigmoid with inconspicuous alæ. Length, 0.119 mm; breadth, 0.004. Striæ 30 in 0.01 mm. Very rare. Known from Ackiko Lake (variety capitata Fontell.).

'A. Schmidt, Atlas Diatom. (1906) pl. 266, fig. 6.

OÖCHORISTICA EXCELSA, A NEW REPTILIAN CESTODE

By Marcos A. Thrangul and Victoria A. Mastlevigan Of the Burcau of Science, Manila

ONE TEXT PIGURE

Two specimens of a new tapeworm were found in the intestine of a grass lizard, *Mabuia multifasciata*. Unfortunately, the head and neck are lacking in one of the specimens, for which reason a comparative study could not be made of these structures.

According to Meggitt (1934), the genus Ochoristica (Luche, 1898) includes twenty-five valid species, the other forms that have been described under the genus being either synonyms or members of closely related cestode genera. To these the following have recently been added: Oöchoristica lygosomæ, described by Burt (1933) from a lizard, Lygosoma punctatum, caught in Colombo, Ceylon; O. thapari, described by Johni (1934). from an Indian lizard, Calotes sp.; and O. taborensis, found by Loewen (1934) in the intestine of a bat in Kansas, United States. Compared with those known species and considering, according to Meggitt, the course of the genital ducts, the extent of the cirrus sac across the proglettis, and the arrangement of the testes as important characters in differentiating between the members of the genus, the Philippine parasite appears to bear the closest resemblance to O. surinamensis (Cohn, 1902), O. fibrata Meggitt, 1927, and O. americana Hardwood, 1932. It may be distinguished, however, from these three species by the smaller dimensions of its body, head, and cirrus pouch, its fewer testes, and the oval shape of the lobes of its ovary.

OCCHORISTICA EXCELSA sp. nov. Text 6g. 1.

Description.—Maximum length about 26 millimeters. Immature and mature segments much wider than long, gravid segments squarish but usually much longer than wide. Extreme measurements of available material gave the following results: Immature segments 0.030 to 0.072 by 0.24 to 0.35, mature segments 0.095 to 0.247 by 0.38 to 0.62, gravid segments 1.9 to 4.7 by 0.55 to 1.1 millimeters. Scolex unarmed, 0.25 millimeter in diameter, separated from the rest of the worm by a very

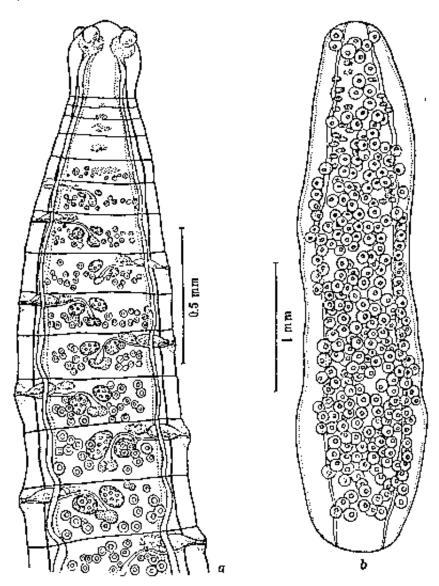

Fig. 1. Obshoristics excells sp. nov.; a, unterior end of worm showing scoler and mature southerface b. a gravid semisorit.

short neck. Suckers 0.075 to 0.088 millimeter in diameter. Genital pores irregularly alternate, situated at posterior border of first third of lateral margins of mature proglottids; in gravid segments they occur at limit of anterior fourth or fifth of

margins. Genital cloaca absent. Genital ducts pass between principal longitudinal excretory vessels.

Male reproductive organs appear to attain maturity before those of the female genital system. Testes apherical, 23 to 29 in number, 19 to 30 microps in diameter, at posterior half of proglottis and extending anteriorly on both sides of median line to middle level of ovary; they are confined between longitudinal excretory vessels. Cirrus sac oval, 0.107 to 0.123 by 0.046 to 0.057 millimeter in size. In mature segments the cirrus sac extends meshally well past the longitudinal excretory vessels, while in gravid segments it does not pass beyond these vessels. Vas deferens short, in loose coils.

Ovary bilobed, immediately preëquatorial, displaced slightly towards poral side of segment; lobes oval, 0.030 to 0.073 by 0.050 to 0.096 millimeter in size. Vitelline gland median, composed of two wings, 0.053 to 0.084 millimeter across, immediately behind ovary. Shell gland small, between ovary and vitelline gland. Vagina opens into genital pore behind cirros. A distinct receptaculum seminis present. Uterine sacs are first seen in eleventh or twelfth segment; a fully developed gravid segment contains at least 250 of these sacs or capsules, each inclosing a single ovum. Uterine capsules 84 to 107 microns in diameter, onchospheres 38 to 46 by 30 to 84 microns in size, and the embryonal hooks about 19 microns in length.

Specific diagnosis.—Oöchoristica: Maximum length 26, maximum breadth 1.1 millimeters. Scolex 0.25 millimeter across. Genital pores irregularly alternate, at limit of anterior third of lateral margins of mature segments; in gravid proglottids at limit of anterior fourth or fifth of margins. Genital cloaca absent. Cirrus sac 0.107 to 0.123 by 0.046 to 0.057 millimeter in size, in mature proglottids half-crossing longitudinal excretory vessels, in gravid segments extending only to vessels. Testes 23 to 29 in number, 19 to 30 microns in diameter, reaching anteriorly to middle level of ovary. Uterine capsules 84 to 107 microns in diameter, onchospheres 38 to 46 by 30 to 34 microns in size, embryonal hooks 19 microns in length.

Host.—Grass lizard, Mabuia multifasciata.

Location.—Intestine.

Locality.—Los Baños, Laguna Province, Luzon.

Type specimens.—Philippine Bureau of Science parasitological collection, No. 506.

DIE STAPHYLINIDEN DER PHILIPPINEN (GATTUNG OXYTELUS)¹

Von MAX BERNHAUER

Offentlicher Notar in Harn, Nieder-Osterreich

Obersicht über die philippinischen Arten der Gattung Ongtelas. 1. Erstes Fühlerglied gegen die Spitze nicht erweitert Halsschild fast ohne Andeutung von Furchen. Einfarbig rötlichgelb, glänzend, fast unbehaart. Kopf so breit wie der Halsschild, mit sehr grossen, fast die ganzen Kopfseiten einnehmenden, ziemlich fein fucettierten Augen, fein und weitläufig punktiert, ohne deutliche Eindrücke. Halsschild fast so breit wie die Flügeldecken, fast um die Hälfte breiter als lang, nach rückwärts geradlinig, etwas ausgeschweift verengt, längs der Mitte mit einer sehr feinen, undeutlichen Längsfurche, an den Seiten schwach niedervedrückt, fein und weitläufig, an den Seiten etwas dichter punktiert. Flügeldselten etwas länger als der Halsschild, fein und wenig dicht, etwas längsrissig punktiert. Abdomen fast unpunktiert. Länge: 2.5 mm. 4. Die seitlichen Längseindrücke des Halsschildes lang, scharf und tief, die Mittelforehen ebenfalls sehr tief und scharf. Molakken, Philippinen, Neu-Britanien fallax Fauv. Die seitlichen Längseindrücke des Halsschildes mehr oder minder flach 5. Hinterleib mit durchgehender schwarzer Mittellinie. Halsschild ziemlich glänzend. Java raptus Fauv. Körper grüsser, Halsschild ziemlich matt, dieht längs gerunzelt. Über Körper kleiner, Halsschild glänzend, ziemlich weitläufig punktiert, kaum längsgestrichelt. Fast über die gunzen Tropen mit Ausnahme des afrikanischen Pestlandes verbreitet (formajische Kr.). Körper klein, Färbung tiefschwarz mit hellgelben Flügeldecken, Halsschild an den Seiten ziemlich gleichmässig gerondet, mit abgerundeten Hinterecken. Über den grüssten Teil der indo-malayischen und afrikanischen Region und Madagaskar verbreitet...... micens Kr. Körper grüsser, Halsschild retgelb, bach rückwärts stack und mehr geradlinig verengt, mit sehr tiefen, schwarzen Parchen. megaceros vae, fincicollis Bernh.

*32. Beitrag zur indo-malayischen Staphyliniden-Fauna.

8. Kopf beim Männchen mit zwei Stacheln am Vorderrand. (Unter-Kopf heim Männchen am Vorderrand ohne Stacheln...... 9. 9. Rückenfläche der Flügeldecken durch eine kräftige scharfe Längsfalte von den herabgebogenen Seiten begrenzt, Augen klein facettiert. (Untergattung Emopotylus.) Körper ziemlich gross, Halsschild fast mehr als doppelt so breit wie lang. Lebhaft rötlichgelb, der Kopf schwarz, die Flügeldecken geschwärzt, in sehr seltenen Fällen hell, die Tergite an der Basis mehr oder minder schmat geschwärzt, die Fühler rostbraun. Kopf beim Männehen fast so breit wie der Halsschild, beim Weibehen viel schmäler, stark quer, vorn stark eingedrückt, gläpzend, hinten kräftig und dicht, beim Männchen längs gestrichelt, beim Weibehen mehr runzelig punktiert, die Schläfen beim Männehen nach rückwarts erweitert, viel länger als die Augen, beim Weibehen viel kürzer, nach hinten nicht erweitert. Fühler gegen die Spitze mässig verdickt, das vierte und fünfte Glied kogelig, die folgenden eine sechsgliedrige Keule bildend, die vorletzten um die Hälfte breiter als lang. Der Halsschild mindestens doppelt so breit wie lang, mit drei tiefen Längsfurchen und einem breiten Seiteneindruck, ziemlich kräftig und ziemlich weitfäufig punktiert, glünzend. Flügeldecken etwas länger als der Halsschild, ziemlich stark und müssig dieht, binten etwas längsrissig punktiert. Hinterleib fast unpanktiert. Länge: 4 bis 5 mm. Luzon, Los Baños. Mindanao, Surigao und Monungan. nigripennis ap. nov. Rückenfläche der Flügeldecken ohne oder nur mit schwacher Begren- Vorderkörper mehr ader minder glänzend und grob skulptiert, Grund-Vorderkörper mehr oder minder matt, ausserst fein skulptiert. Grund-11. Halsschild mehr oder minder weitläufig oder nur mässig dicht punk- Flügeldecken einfach und sehr weitläufig punktiert. Kürper grösser, 3 bis 4 mm..... bakeri Bernh. 13. Körper grösser (3 mm) Kopf glänzend, nicht chagriniert. nitidifrous Woll. Körper kleiner (1.5 bis 2.5 mm), Kopf wenigstens beim Männchen teil-14. Kopf beim Männehen sehr stark erweitert, zwischen den Augen aussert fein und ganz matt chagriniert ohne deutliche Punktierung, beim Weibehen glänzend, viel schmüler als der Halsschild. Einfarbig rötlichgelb, mit etwas dunklerem Kopf. Fühler ziemlich gestreckt. die vorletzten Glieder schwach quer. Halsschild um mehr als die Hälfte breiter als lang, verkehrt trapezförmig, mit drei tiefen Längsfurchen und je einem beeiten Seiteneindruck, ziemlich kräftig und wenig dicht punktiert, glänzend. Flügeldecken etwas länger als der

Halsschild, kruftig und dicht längsgerunzelt, wenig glänzend. Länge: 1.5 bis 2.5 mm. Mindoko, Subsan. Lozon, Mount Maquiling, Mount

	isarog, Imugan, Balbalan, Bayombong, Los Baños, Limay, Pagsanjan.
	Mindanae, Surigae. Bilinan kostilis ap. nev. Kopf beim Münnehen weniger erweitert, zwischen den Augen deutlich
	punktiert
7.5	Holeschild nomantich an den Caitan Maken anntel at
10.	Halsschild namentlich an den Seiten dichter punktiert. 16.
	Halsschild überall sehr weitläufig punktiert. Dem hostilis sehr nahe
٠	verwandt und ihm in Gestalt und Färbung sehr ähnlich, durch viel
	weitläufigere Punktierung und besonders im männlichen Goschlecht
	durch weniger erweiterten und zwischen den Augen nicht matt chug-
	rinierten, sondern ziemlich glünzenden, müssig fein und wenig dicht
	punktierten Kopf verschieden. Länge; 2,2 mm. Luzon, Pagsanjan.
	pugsunjanensis sp. nov.
10.	Kopf zwischen den Augen matt chagriniert, mässig fein und mässig
	dicht punktiert, mit starker von der rückwartigen Querfurche his
	zum Stirneindruck gehender Längsfurche, Färbung wie bei den vorher-
	gehenden beiden Arten. Lünge: 2.2 mm. Luzon, Imugan,
	sulciceps sp. nov.
	Kopf zwischen den Augen wenig chagriniert, wenig fein und ziemlich
	dicht punktiert, die Stirnfurche nach vorn verkürzt. In der Fär-
	bung kaum verschieden. Hange 2.2 mm. Luzon, Bangoi.
4.0	mixtus ap. nov.
11.	Flügeldecken grob und dicht, höchstens hinten langsstreifig punk-
	tiert, 18
	Flügeldecken wenig grob oder fein, bis zur Basis lüngsstreißig und
10	kielförmig skulptiert
J D.	Halsschild und Flörretdecken sehr dicht punktiert, wenig glänzend.
	Rötlichbraun, der Hinterleib heller, Taster und Beine rötlichgelb,
	Fühler rosthraun. Kopf schmäler als der Halsschild, matt chagri-
	niert, ohne deutliche Panktierung, der seharf begrenzte Stieneindruck
	spiegelbiank. Halsschild um die Hälfte breiter als lang, mit den
	normalen Eindrücken, grob und sehr dicht längsronzelig punktiert.
	Flügeldecken etwas länger als der Halsschild, grob und sehr dicht,
	teilweise längsrunzelig, an der Basis nahezu einfach punktiert.
	Länge: 2.5 mm. Luzon, Laguna, ein einziges Exemplar.
	fortipennis sp. nov.
	Halsschild und Flügeldecken mässig dicht punktiert, stark glänzend,
	im ührigen kaum von dem vorigen verschieden. Länge: 2.5 mm.
10	LUZON, Balhalan, ein einziges Exemplar balhalanansis ap. nov. Kopf zwischen den Augen ganz matt chagriniert 20.
15.	Kopf zwischen den Augen deutlich etwas seidenglänzend. 21.
20	Halsschild nicht allzu dicht und stark punktiert, glänzend, Kopf aus-
_,,,	serordentlich fein chagriniert, ohne jede weitere Skulptur. Einfar-
	hig rötlichgeth, mit belieren Tastern und Beinen. Der Kopf beim
	Männehen mässig, beim Weibeken viel sehmaler als der Halsschild,
	die Schläfen beim Männehen so lang, beim Weibehen viel kürzer als
	der Längsdurchmesser der Augen. Halsschild etwa um die Hälfte
	breiter als lang, ausser den normalen Eindrücken stark und müssig
	dicht gerunzelt-punktiert, glänzend. Flügeldecken mässig kräftig
	and nicht allzu dicht, in langen, schmalen Kiellinien längsgestreift,
	ziemlich glänzend. Länge: 2.3 bis 2.8 mm. Luzun, Laguna und
	Imugan serietices sp. nov
	was a process of the contract

Halsschild sehr dieht und fein punktiert, wenig glänzend, Kopf namentlich beim Männehen deutlich längsgestrichelt, Körper viel kleiner, Färbung dieselbe. Kopf beim Männehen fast breiter, beim Weibehen mässig schmaler als der Halsschild, die Schläfen beim Männehen fast doppelt so lang, beim Weibehen wenig kürzer als der Längsdurchmesser der Augen. Die Skulptur des Halsschildes und der Flügeldecken ist viel feiner und dichter, die Oberfläche mit geringem Glanze. Länge: 1.5 bis 1.8 mm. Luzon, Los Baños. Saman, Catbalogan.

cameroni sp. nov.

- 22. Halsschild ziemlich stark längsgestreift, pechschwarz, die Taster und Being rötlichgelb, die Fühler bräunlich mit helter Wurzel und Spitze. Kopf viel schmäler als der Halsschild (Weibehen) sehr fein chagriniert, an den Seiten deutlich längsrissig, mit Ausnahme des glänzenden Stirneindruckes wenig glänzend, Augen gross, die Schläfen ziemlich kurz, unmittelbar hinter den Augen in flachem Bogen schräg gegen den Hals verlaufend. Halaschild verkehrt trapezförmig, nicht ganz um die Hälfte breiter als lang, mit scharf rechteckigen Hinterecken, ausser den normalen, ziemlich tiefen Furchen kräftig, gegen die Mitte zu schwächer längsgestreift, ziemlich glänzend. Flügeldecken etwas länger als der Halsschild, ziemlich kräftig und ziemlich dicht längsgestreift, ohne eigentliche Punktierung. Länge: 2 mm. MIN-DANAO, Surigao. Ein einzelnes Exemplar...... aciculatus sp. nov. Halsschild ausserordentlich fein längsgestreift, schmatziggelb, mässig glänzend, der Mund und die Beine rötlichgelb, die Fühler brünlich. Kopf beim Weibehen ühnlich wie bei der vorigen Art, jedoch mit stärker gerundeten Schlifen, beim Männehen viel breiter und größer, fast zo breit wie der Halsschild, mit parallelen, langen Schläfen, ausser dem glanzenden Stirneindruck äusserst fein und dicht chagriniert, ziemlich matt. Halsschild um die Hälfte breiter als lang. nach rückwärts mässig verengt, mit stompfen Hinterecken, ausser den mässig tiefen, normalen Löngseindrücken sehr fein und dicht längsgestreift, mässig glänzend. Flügeldecken ziemlich kräftig und ziemlich dieht längsrissig punktiert. Länge: 1.2 bis 2 mm. Mtx-DANAO, Port Bauga und Momungan. Minduno, San Teodoro. Sian-GAO, Dapa tennistrigorus sp. nov.
- 23. Halsschildkiele stark glänzend pygmans Kr.
 Halsschildkiele nicht oder kaum glänzend 24.

25,	Halsschild um'ein Drittel breiter als lang 26.
	Halsschild um die Hülfte breiter als lang. Rötlichgelb, matt, die
	Flügeldecken etwas dunkler. Kopf beim Männehen so breit wie der
	Halsschild, mit lungen Schläfen, nach hinten etwas erweitert, äusserst
	dieht chageiniert, beim Weibehen sehmäler als der Halsschild, Schläfen
	kürzer. Halsschild verkehet trapezfürmig, äusserst dicht, matt chag-
	riniert. Flügeldecken wenig länger als der Halsschild, ebenso dicht
1	wie dieser, aber stärker chageiniert. Flänge: 1.5 bis 2 mm. Luzon,
	Mount Maquiling. MINDORD, San Teodoro, haronicus sp. nov.
26.	Klypeus nicht glänzend, wie der übrige Kopf matt obsenzus Cam.
	Klypeus mehr oder minder glänzend
27.	Körper schworz bis pechbenun, Flügeldecken gekörnt punktiert.
	minutus Cum.
	Körper rötlichgelb, Flügeldecken dicht längsgestrichelt, Fühler, Taster
	und Beine etwas blasser. Kopf schmäler als der Heleschild (Weib-
	chen) mit Ausnahme des Klypeus matt chagriniert. Halsschild ver-
	kehrt trapezförmig, etwas mehr als ein Drittel breiter als lang, matt
	chagriniert, die drei Halsschildfurchen ziemlich scharf, der Seiten-
	eindruck deutlich. Flügeldecken länger als der Halsschild, dicht
	und deutlich längsgestreift. Länge: Kanm 1 mm. Juzon, Los Baños,
	ein einziges Weibchen litiputanus sp. nov.
28.	Vorderkörper matt
	Vorderkörper mehr oder minder glänzend 30.
an.	Vorderkörper vollkommen glanzlos, Halsschild ohne Andeutrang einer
29.	
	Mittelfurche, die Stacheln am Vorderrand der Stirn beim Männchen
	an der Spitze nach auswärts geschwungen. Schwarzbraun, die
	Wurzel der gebrüunten Fühler und der Mund dunkler, die Beine
	heller rötlichgelh. Kopf beim Männchen fast breiter, beim Weibehen
	schmäler als der Halsschild, beim Männehen nach hinten erweitert,
	mit langen Schläfen, beim Weibehen wit kurzen, nach rückwarts
	verengten Schläfen, der Stieneindruck beim Männehen stark, beim
	Weibehen schwach glänzend. Die Fühler gegen die Spitze stark ver-
	dickt, die vorletzten Glieder stark quer, das erste Glied beim Münn-
	chen stark verdickt. Halsschild fast so breit wie die Flügeldecken,
	enen stark berniekt. Habsbellich hast so bleit wie inte Plagetateken.
	um die Hälfte breiter als lung, nach rückwärts stark verengt, die
	drei Mittelfurchen kaum angedeutet, die seitlichen Eindrücke deut-
	lich. Die Flügeldecken mutt chageiniert, bei gewisser Ansieht mit
	rötlichem Kupferschimmer, wenig länger als der Halsschild. Hinter-
	leib glänzend, nur undeutlich punktiert. Länge: 1.5 bis 1.8 mm.
	Luzon, Los Baños und Mount Maquiling. MINDORO, San Tendaro.
	Physics Panes and grount bidding. Mistory, 240 teacher.
	planaticollis sp. nov.
	Vorderkörper mit sohr schwachem, aber immerhin wahrnehmbarem
	Fettschimmer, Halsschild mit deutlicher Mittelfurche, die Stacheln
	am Vorderrand der Stirn beim Männchen gerade. Färbung etwas
	weniger dunkel, die Flügeldecken an der Basis rötlichgelb. Kopf.
	beim Männehen nicht breiter als der Halsschild, nach hinten kuum
	heim Mannenen ment breiter als der Halssenid, Baen ninten kuum
	erweitert, beim Weibehen beträchtlich schmäler als der Halsschild

mit kurzen Schläfen. Fühler kaum verschieden. Stirmeindruck auch beim Weibehen deutlich glänzend und mit einem Höckerchen verzehen. Halsschild fast noch kürzer, mit schurfen Hinterecken, vor

diesen unmerklich gebuchtet, die seitlichen Mittelfurchen gut angedeutet. Flügeldecken ohne Kupferglanz. Länge: 1 bis 2 mm.
Luzon, Los Baños. Mindoro, San Teodoro, cornetus sp. nov.
30. Halsschild stark glänzend, nicht oder ner weitläufig längsgestrichelt.

Halsschild nur müssig glünzend, ziemlich dicht längsgestrichelt. Pechschwarz, die Fühler und Taster bräunlich, die Beine hollgelb beim Münnchen: Kopf so breit wie der Halsschild, um ein Drittel breiter als lung, nuch rückwärts backenartig erweitert, der Eindruck im vorderen Teil, sowie eine Mittelzone auf dem erhobenen Teil geglättet, stark glänzend, die Seiten neben den Augen stark chagriniert und hinter den Augen dicht längsgerunzelt. Die Fühler sind mässig verdickt, his zum Hinterrand des Halsschildes reichend, die vorletzten Glieder um die Hälfte breiter als lang. Halsschild um die Hälfte breiter als lang, nach rückwärts stark verengt, vor den scharfen Hinterecken tief ausgeschweift, in der Mitte mit drei starken Furchen, seitlich mit einem flachen Eindruck, dicht längsrissig skulptiert, nur die beiden Kiele zwischen den Furchen geglättet. Flügeldecken länger als der Halsschild, stark quer, sehr dicht und kräftig längsgestreift, wie der Halsschild müssig glänzend. Hinterleib stark glänzend, kaum punktiert. Länge: 2,1 bis 2,5 mm. MINDANAO, Surigao militaris sp. nov.

31. Halsschild an den Seiten weitläufig längsgestrichelt und mit einem ziemlich starken Eindruck. Schmutzig rötlichgelb, glänzend, der Hinterleib dunkler, die Wurzel der bräunlichen Fühler, die Taster und Beine blussgelb. Kopf so breit wie der Halsschild, mässig breiter als lang, binter den Augen gerade, unmerklich erweitert, an den Seiten matt eingriniert, längs der breiten Mittelzone und der Stirneindruck geglättet. Föhler kurz, die vorfetzten Glieder fast doppelt so breit wie lang. Halsschild fast so breit wie die Ffügeldecken, stark quer, nach rückwärts stark verengt, mit geradlinigen Seiten und stumpfwinkeligen Hinterecken, mit tiefer Mittelfurche, vor der Busis mit zwei kleinen Furchen, seitlich fein und wenig dicht längsgestrichelt. Ffügeldecken länger als der Halsschild, wenig dicht längsgestrichelt, glänzend. Hinterleib kaum punktiert. Länge: 1.5 mm. Mindoso, San Teudoro, ein einziges Männehen.

Intsschihl an den Seiten ohne Strichelung. Dunkel rötlichgelb his pechfarhen, glänzend, die Fühlerwarzel, die Taster und Beine blassgelb. Kopf beim Männehen nicht oder kaum schmäler als der Halsschild, mit parallelen, den Augendurchmesser an Länge überragenden Schläfen, beim Weihehen viel schmäler als der Halsschild, nach rückwärts verengt, mit kurzen Schläfen, glunzend glatt, nur mit einzelnen Punkten, beim Männehen hinter den Augen äbsserst fein ehagriniert und zwischen den Augen ungemein fein, schwer sichtbar längsgestrichelt. Stirn beim Männehen nicht wie bei den vorherigen Arten mit zwei langen, geraden Stucheln an den Seiten, sondern mit zwei seharfen, dicht aneinanderliegenden Zähnehen in der Mitte des Vorderrandes. Fühler wie bei der vorigen Art. Halsschild beim Mönnehen stark, beim Weibehen mässig quer, verkehrt trapezförmig mit

stumpf verruhdeten Hinterecken, längs der Mitte mit einer in der Regel in der hinteren Hälfte verkützten, bisweilen jedoch durchgehenden tiefen Längsfurche, sonst fost ohne jede Skulptur, stark glänzend, ohne deutlichen Seiteneindruck. Flügeldecken etwas länger als der Hulsschild, glänzend glatt, fast ohne jede Andeutung einer Punktierung. Von Oxytelus uneifer Fanv., dem die Art sehr nahe steht, unterscheidet sie sich durch das Fehlen der seitlichen Mittelfurchen und der Seitengruben am Hulsschild und den Mangel der Flügeldeckenpunktierung. Länge: 2 bis 2.5 mm. LUZOK, Los Baños und Mount Banahao. Mindanao, Momungan und Port Banga.

hidentatus sp. nov.

NEW LONGICORN BEETLES FROM FORMOSA, III (COLEOPTERA: CERAMBYCIDÆ)

By J. Linsley Gressitt Of the University of California, Revieley

ONE PLATE

The following descriptions are based on material collected by the author during two trips to Formosa, in 1932 and 1934, respectively. Two of the forms herein described are interesting as being subspecifically related to more northern forms. from north-central China and the northern Loochoo Islands. respectively. Several of the other new species represent various new genera, some of which are apparently without very close affinities, and others have tropical Oriental relationships. The types are deposited in the United States National Museum, Washington, D. C., and in the California Academy of Sciences, San-Francisco, those in the latter being unnumbered unique types on loan deposit. Types previously designated by the writer as "in the author's collection" are similarly deposited in the collection of the California Academy of Sciences. The author is indebted to Dr. E. C. Van Dyke and Mr. E. P. Van Duzee for use of material in the California Academy of Sciences.

CERAMBYCINI

Cerambyx minutum Gressitt is a synonym of Dymasius kisanus Matsushita, having been published one day later than the latter name. The type locality of C. minutum, "Kamikochi, Japan," is erroneous, and should have been Kisan, Formosa, the same as for D. kisanus. The author's specimen was received in 1932 from Y. Yano, the collector of Matsushita's material, but it was in an envelope with lepturids from Kamikochi. The carelessness of the above collector is further evidenced by the writer having seen lepturids from Kamikochi in collections sent to this country labeled as from Kisan, Formosa.

Philip, Journ. Sci. 55: 379, published March 8, 1935,

⁴ Trans. Nat. Hist. Soc. Formosa 25: 540, published March 7, 1935.

CALLICHBOMINE

Genus AROMIA Serville, 1833.

AROMIA PALDERMANNI subsp. INSULARIS Greatti sebap, pav. Plate L fig. 1,

Large, handsome; body largely iridescent green or violet; head violet-black, greenish on frons and occiput; mandibles blue laterally; antennæ dull blackish apically, scape shiny favender, blue, or green, the following three segments iridescent purplish blue; prothorax purplish blue with a large orange area on each side reaching from apex to near base and to two pairs of tubercles on each side of middle of disc, greenish and coppery below, the process bluish black; scatellum deep blue or green; elytra variable, greenish basally, remainder greenish purplish brown; legs purplish blue or greenish, tarsi testaceous; ventral surface dark greenish with purplish tinges.

Head broad; antennal supports high and close; from small; genæ large; surface minutely punctulate, irregularly clothed with dark hairs. Antennæ slightly longer than hody in male, three-fourths as long in female; third segment longest; fourth to tenth decreasing slightly, acute externally at apices. Protherax broad, with a thick tubercle at each side, and six on disc: One behind middle of anterior margin, a pair near center and three posteriorly, outer posterior ones highest, subtransverse; surface with erect dark hairs, particularly on the purple area. Scattellum clongate-triangular, grooved. Elytra slightly narrowed, rounded apically, and microgranulose-punctate. Hind tibiæ compressed and sinuate; first segment of hind tarsus not quite as long as remaining united. Length, 34 to 46 millimeters; breadth, 9.5 to 12.5.

Holotype, male, No. 51424, United States National Museum; Bukai, central Formosa, altitude 1,400 meters, June 16, 1934; allotype, female, Hassenzan, Formosa, altitude 1,500 meters, June 24, 1934; paratopotype, male, June 15, five paratypes, Hori, Formosa, altitude 600 meters, June, 1934; and one paratype, male, Hinokiyama, northern Formosa, altitude 1,600 meters, July 16, 1934 (Y. Izumi) in the author's collection; one paratype, Hori, in the California Academy of Sciences.

Differs from Aromia faldermanni Saund, from northern China, as which the present form has already been recorded from Formosa, in being larger, in having the antennæ entirely dark, instead of orange on the latter seven segments, and in

^{*}Trans. Ent. Soc. London II 2 4 (1850) 111, pl. 4, ftg. 7.

having the orange portion of the prothorax separated into two spots, with the central portion violet, instead of extending completely across the dorsal surface. In insularis the vertex is more deeply, and narrowly, grouved, the prothorax is more constricted before the lateral inhereles, the posterior tuberele of each side of the disc is more pronounced, and the scutellum is narrower and more deeply grouved. Specimens from northern Formosa (Hinokiyama) differ slightly in having the scape and anterior pairs of legs more greenish than purple, and the elytra largely greenish; but the iridescent coloration in these forms is exceedingly variable.

Genus CHLORIDOLUM Thomson, 1864

CHLORIDOLUM LOOCHODANUM subap. TAIWANUM Cresaltt anbug, nov. Plate 1, fig. 2.

Moderately small; elegant, bright green; antennæ violet-blue; legs steel-blue; pronotum bluish on disc; scutellum shiny, slightly bluish green; elytra frosted green, lighter on shoulders and along basal portion of suture, slightly darker on disc; mandibles black at apices; palpi testaceous, with apical segments of both pairs brown except at apex; ventral surface bright green, finely clothed with short silvery pile.

Head moderately punctured on occiput and behind eyes, more finely and sparsely on vertex, frons, and gence, and finely and densely on mandibles; gular area transversely, and subocular areas sublongitudinally, corrugated; from and vertex narrowly midlongitudinally sulcate to between eyes. Antennae two and one-third times as long as body in male, one-third longer in female; scape thick, subacute ectoapically, grossly punctured. subobliquely grooved externally; fourth segment slightly shorter than third, last longest. Prothorax longer than breadth at base, laterally armed slightly behind middle with a blunt tubercle with a short, acute tip; disc transversely striolate near apex and base, transversely or obliquely so at sides, and longitudinally in middle, with the outer longitudinal strioks diverging and incompletely meeting the lateral ones in a blue, punctured area on each side of center; underside transversely corrugated anteriorly, subvermiculose punctate posteriorly; area around lateral tubercles smooth. Scutellum triangular, subscute behind, longitudinally grooved, nearly impunctate. Elytra narrowed posteriorly; apices narrowed and obtusely angulate near suture; surface granulose, except along suture near scutellum where it is finely, transversely corrugated and shiny. Legs and ventral surface finely punctured. Length, 14.5 to 18 millimeters; breadth, 3 to 4.

Holotype, male, No. 51425, United States National Museum; Bukai, Formosa, altitude 1,400 meters, June 12, 1934; allotopotype, female, and six paratopotypes in the author's collection; one paratopotype in the California Academy of Sciences; all taken by the author, June 12 and 14.

Differs from C. loochooanum Gressitt, from Amami-Oshima Island, in being smaller, in having the elytra green instead of bluish, only the central part of the disc of prothorax blue, the labrum green instead of black, the vertex lacking ridges and strioke parallel to the median groove, the scutellum narrower and longitudinally grooved, the elytra more strongly narrowed and more scute apically, and the abdomen smoother.

MOLORCHINI

Genus KURARUA Gressitt novum

Narrow, elytra narrowed and slightly outwardly curved posteriorly, slightly abbreviated; antennæ with third segment minute, posterior seven segments long and thickened; eyes finely faceted and emarginate; anterior coxæ subconical, their cavities subacute externally, and apparently open behind; middle coxat cavities very narrowly open externally.

Head longer than broad, slightly broader than prothorax; neck narrowest immediately behind the eyes; eyes minutely faceted, prominent, very narrowly constricted behind the antennal insertions; the antennal supports broad, rounded; the vertex narrow, medially suicate to middle of frons, with a row of punctures on each side; from short and broad, an impunctate area at middle of apical margin and a pit at each side near clypeus: clypeus very broad basally, basal margin rather concave, apical margin slightly so; labrum transverse, very short; mandibles moderate, apices acute, sides densely punctate; palpi short, the last segment subelliptical; genæ short. Antennæ (male?) onethird longer than body, moderately thick, except for second to fourth segments: scape three times as long as broad, arched; second segment minute, longer than broad, thickened apically; third segment minute, no thicker than, and but twice as long as, second; fourth segment half again as long as third, subequal to scape; fifth segment large, as long as two preceding combined, apex broadened, external angle subscute; following segments similar and progressively slightly longer; apical segment longest, with the apical fifth narrowed; first four segments

^{&#}x27; Pan-Pacific Entomol. 9: 162,

Holotype, male, No. 51425, United States National Museum; Bukai, Formosa, altitude 1,400 meters, June 12, 1934; allotopotype, female, and six paratopotypes in the author's collection; one paratopotype in the California Academy of Sciences; all taken by the author, June 12 and 14.

Differs from C. loochoomum Gressitt, from Amami-Oshima Island, in being smaller, in having the elytra green instead of bluish, only the central part of the disc of prothorax blue, the labrum green instead of black, the vertex lacking ridges and stricke parallel to the median groove, the scutellum narrower and longitudinally grooved, the elytra more strongly narrowed and more acute apically, and the abdomen smoother.

MOLORCHINI

Genus KURARUA Gressitt novum

Narrow, elytra narrowed and slightly outwardly curved posteriorly, slightly abbreviated; antennæ with third segment minute, posterior seven segments long and thickened; eyes finely faceted and emarginate; anterior coxæ subconical, their cavities subacute externally, and apparently open behind; middle coxal cavities very narrowly open externally.

Head longer than broad, slightly broader than prothorax; neck narrowest immediately behind the eyes; eyes minutely faceted, prominent, very narrowly constricted behind the antennal insertions; the antennal supports broad, rounded; the vertex narrow, medially suitate to middle of frons, with a row of punctures on each side; from short and broad, an impunctate area at middle of apical margin and a pit at each side near elypeus; clypeus very broad basally, basal margin rather concave, apical margin slightly so; labrum transverse, very short; mandibles moderate, apices acute, sides densely punctate; palpi short, the hast segment subelliptical; genæ short. Antennæ (male?) onethird longer than body, moderately thick, except for second to fourth segments; scape three times as long as broad, arched; second segment minute, longer than broad, thickened apically; third segment minute, no thicker than, and but twice as long as, second; fourth segment half again as long as third, subequal to scape; fifth segment large, as long as two preceding combined, apex broadened, external angle subacute; following segments similar and progressively slightly longer; apical segment longest, with the apical fifth narrowed; first four segments

^{*}Pan-Pacific Entomol. 9: 163.

slightly shiny and punctate, following segments dull, covered with minute, recumbent, bristlelike hairs. Prothorax subcylindrical, two-fifths again as long as broad, narrower than elytra; base as broad as middle; apex slightly narrower; disk fairly even, moderately sparsely punctate. Scutellum minute and narrow, apical portion concave. Elytra narrow, broadest basally, constricted antemedially, slightly narrowed posteriorly, not quite reaching apex of abdomen; apices narrowed externally and rounded; surface with fairly dense shallow punctures. Anterior coxal cavities slightly rounded, broader than long, subacute externally, apparently open behind, moderately separated, the intercoxal process expanded and rounded posteriorly; middle coxal cavities extremely narrowly open to epimera; intercoxal process of mesosternum broad, reaching just beyond middle acetabula, its apex concave, receiving process of metasternum; metasternum swollen and fairly densely punctured; metepisternum large, swollen posteriorly. Abdomen with first segment nearly as long as following two combined; second to last segments subequal, the fourth shortest. Legs fine, femora pedunculate and apically clavate; hind tibbe slightly arched; first tarsal segments slightly shorter than following two segments combined in anterior pair, subequal in second pair, and only slightly longer in hind pair.

Genotype.—Kurarua constrictiponnis Gressitt sp. nov.

Range.-Formosa (southern tip).

This genus is doubtfully placed in the Molorchini because the anterior coxal cavities are seemingly opened behind and the middle coxal cavities are very narrowly open exteriorly. It differs from most of the genera in the tribe in the very short third and fourth antennal segments, the smooth prothorax and long elytra. It differs from *Kunbir* in its much narrower form, longer and different antennæ and prothorax, and more suddenly, and more briefly, clavate hind femora.

RURARUA CONSTRUCTIPENNIS Greatlet op. nov. Plate 1, 62, 5,

Black, prothorax (except anterior margin) and forclegs red; elytra reddish brown basally and grayish brown on apical two-thirds. Body clothed with reddish brown hairs above and whitish hairs below.

Moderately small, narrow; prothorax long and plain; elytra constricted antemedially, narrower and divergent posteriorly, not quite reaching apex of abdomen; antennæ slightly longer than body, third segment minute, only twice as long as second, and two-thirds as long as fourth, the latter equal to scape, fol-

lowing segments long and thick, slightly flattened; legs fine, femora pedunculate and clavate, hind pair barely so for apical third. Length, 9.2 millimeters; breadth, 1.8.

Holotype, male (?), California Academy of Sciences; Kuraru, Koshun, near South Cape, Formosa, altitude 140 meters, April 10, 1932, taken by the author.

This species superficially resembles Cleomenida setigera Schw. in appearance, because of its narrow form, red thorax, and clavate femora, but is easily distinguished by its peculiar antennæ, more cylindrical prothorax, and narrowed clytra.

Genus MERION(EDA Pascoe, 1858

Matsushita has synonymized Merionæda uraiensis Kano with M. formosana Heller hand Mitono has followed him. These species, however, are quite distinct. The two may be distinguished as follows:

Eighth and ninth antennal segments one-fourth as broad as long; middle femora clavate for less than apical half; hind femora clavate for only apical third, the club narrower than head; tibial spines inclined.

CLYTINI

Genus XYLOTRECHUS Chevrolat, 1860

XVLOTRECHUS RUFONOTATUS Greinkt sp., nov. Pfate 1, fg. 3.

Moderately small, narrow, attenuated posteriorly; body black, except for an orange-red pronotal spot centered slightly before middle of disc; surface densely clothed above with green pile, paler on scutellum, and below with greenish gray, paler at the sides; antennæ basally with sparse, fine, greenish hairs, apically with microscopic recumbent hairs; legs sparsely clothed with subcreet, and some longer erect, pale hairs.

Head abbreviated below; surface granulose punctate, with some large punctures below eyes; vertex and from with a pair of approximate carinæ, converging at each end, on middle of vertex, and lower part of from; from narrow, subparallel, very slightly narrowed in middle, lateral carinæ obscure; eyes

^{*}Journ. Pac. Agr. Hokkuido Imp. Univ. 34 2 (1933) 229.

⁴ Ins. Matsumuriana 5 (1930) 43, fig. 1. ⁷ Ent. Blätt, 20 1 (1924) 32,

⁴ Mushi 8 1 (1985) 53.

inverted comma'shaped; palpi fine, apical segments twice as long as broad, rounded-truncate, not broadened, apically. Antennæ (female) short, fine, thickened apically; scape over twice as long as second segment and slightly longer than third; fourth and fifth subequal, each slightly shorter than third; following decreasing; tenth hardly longer than its diameter. Prothorax longer than broad, subcylindrical, only slightly swollen at sides; apex nearly as broad as base; disc somewhat raised postmedially, surface densely and fairly heavily punctured, some very large shallow punctures at sides. Scutellum rounded, less than twice as broad as long. Elytra slightly broader than prothorax, not quite twice as long as head and prothorax united, gradually narrowed posteriorly; apices subtransversely truncate, a very short tooth at sutural angle; surface densely and finely punctured. Metepisternum very narrow, apparently broader posteriorly. Legs with femora only slightly swollen; middle femora most heavily punctured; hind femora slightly exceeding elytral apices; first segment of hind tarsus two and one-half times as long as following two united. Length, 11.5 millimeters; breadth, 2.8.

Holotype, female, a unique, California Academy of Sciences; Hassenzan, Formosa, altitude 1,800 meters, June 21, 1932; taken by the author.

Differs from X. cinerascens Matsushita in its smaller size, more parallel and less prominently carinate from, the two sides of the narrowly elliptic carinae very close, the prothorax more cylindrical, the scutellum narrower, and the first segment of hind tarsus relatively shorter.

Genus PERISSUS Chevrolat, 1863

PERISBUS GRISEUS Gressift op. nov. Plate 1, ug. 8,

Small, abbreviated, subparallel; hody black, fairly well clothed with pale greenish gray pubescence, whitish on sides of hind margin of prothorax and undersurface of body, where it is denser on sides of meso- and metathorax; body also with many erect pale hairs, except on tarsi and posterior three-fourths of elytra; antennæ with some moderate hairs on scape and a few projecting ones on inner side of following four segments, besides very fine pubescence covering their entire surface.

Head wider than high in front; finely punctured, with some large punctures on occiput and genæ; antennal insertions moderately distant, hardly raised; vertex plain; eyes inverted comma-shaped, deeply constricted; frons nearly as broad as long;

clypeus glabrous apically, apical palpal segments subtransversely truncate. Antennæ (female) hardly over half body length, somewhat thickened apically; scape as long as second and third segments combined; fourth shorter than third, equal to following; latter few, slightly shorter. Prothorax subcylindrical, no longer than broad, slightly broader at apex than base, slightly swollen at sides; granulose-punctate above. Scutellum short, broad, and rounded. Elytra twice as long as head and prothorax united, broader than prothorax, slightly narrowed posteriorly, separately narrowed and subobliquely truncate at apices; surface minutely granulose-punctate. Legs fine; hind femora and tibiæ sinuate, the femora reaching just beyond clytral apices; first segment of hind tarsus barely twice as long as following two segments united. Length, 8 millimeters; breadth, 21.

Holotype, female, a unique, California Academy of Sciences; Taiheizan, Formosa, altitude 1,600 meters, May 10, 1932; taken by the author.

Differs from P. kankauensis Schwarzer and the other species of the genus in lacking spots or fascise. The head is very short in front, the prothorax short and the scutellum broad.

Genus RAPHUMA Pascoe, 1858

RAPHUMA NOTABILOIDES Greenfil up. nov. Plate 1, Sg. 4.

Large, cylindrical, subparallel; hody black, densely clothed with green or gray pubescence, paler beneath and nearly white at sides, marked with black as follows: A transverse suboval black spot on each side of middle of disc of prothorax, elytra with the external margins narrowly so for most of their length, each with a straight longitudinal stripe from humerus to end of first third, a line curving out from behind scutellum, extending posteriorly, then transversely outward, joining end of humeral stripe, next a fairly large irregular median spot, touching margin but not suture, and finally a large, free, subcircular spot, one-fourth from apex; antennæ clothed with fine, adpressed, greenish gray hairs; some subcreet brownish hairs on underside of third and fourth segments; legs with the fine hairs goldish on tarsi, some brownish spinelike hairs on undersides of femora and tibiæ.

Head strongly punctured on either side of occiput and below eyes; eyes large, distant; from slightly longer than broad, narrowed basally. Antennæ five-sixths as long as body in male, four-fifths in female; third segment longer than scape; fifth to seventh subequal, each longer than fourth and shorter than

third; remaining shorter; seventh to tenth broadened externally at apices. Prothorax broadest behind middle, narrowed apically; surface finely granulose. Scutellum rounded behind. Elytra slightly broader than prothorax, less than twice as long as anterior part of body; apices subobliquely truncate, dentate at both angles. Legs fairly fine; hind tarsi with first segment twice as long as following two united. Length, 17 to 20 millimeters; breadth, 4 to 4.5.

Holotype, male, No. 51426, United States National Museum; Sakaben, castern Formosa (southwest of Karenko), altitude 1,350 meters, July 13, 1934, two paratopotypes and a female doubtfully referred to this species, Hassenzan, Formosa, altitude 1,400 meters, June 23, 1934, in the author's collection; all taken by the author.

This species is very similar in size and markings to Chlore-phorus notabilis Pascoe, and quite probably represents the form recorded from Formosa as that species. It differs from the latter in having the antennæ much finer, with the third segment longer than the first, the pronotum smoother, and the legs much finer, with the first tarsal segment much longer. Differs from Raphuma virens Matsushita in its much larger size, more sulphurous coloration, more swollen prothoracic disc, and relatively longer third antennal segment and first hind tarsal segment. One of the paratopotypes is gray instead of yellowish green, with the markings less distinct. The specimen from Hassenzan is entirely gray.

Genus DEMONAX Thomson, 1860

DEMONAX MATSUSHITAI Cressitt ab. nov. Plate J. Sc. 10.

Small, narrow, parallel; black, clothed with gray pubescence; elytra with three pairs of dull black fasciæ, the first consisting of a narrow oblique line from suture just behind scutchum to middle of disc, one-fifth from base, and a curved humeral line which nearly meets the former at its apex, second a moderately broad suboblique band slightly before middle, reaching from suture to margin, narrower anteriorly near suture, third transverse, wide, one-fourth from the apex, slightly constricted at the suture, all the bands with a few intermixed gray hairs and their margins indefinite, scutchum and undersides of pro- and mesothorax whitish gray; some subcreet pale hairs on legs and undersurfaces of basal antennal segments and apices of following segments.

Head small, as deep as wide; occipet with some large punctures at sides; eyes distant, deeply emarginate; vertex concave; antennal supports subacute internally; from longer than broad, broader apically. Antennæ nearly as long as body in male, reaching to last quarter of clytra in female; scape not swollen apically, twice as long as second segment; third nearly half again as long as scape and fourth; fifth longer than fourth and following; third and fourth each with an apical spine onefourth as long as the following segment, that of the fourth the longer. Prothorax one-fourth longer than broad, and very briefly constricted at apex and base; sides moderately swollen; surface shallowly reticulate-punctate with a few deeper punctures posterolaterally. Scutellum narrowly rounded behind. Elytra slightly broader than prothorax, parallel; apices transversely subsinuate-truncate, external angles minutely toothed. Legs fine; hind femora hardly swollen; hind tarsi shorter than tibiæ, first segment nearly twice as long as remaining united. Length, 8.5 millimeters.

Holotype, female, No. 51427, United States National Museum; Hassenzan, Formosa, altitude 1,800 meters, June 24, 1934; and paratopotype, male, in the author's collection, taken the same day.

Differs from D. sauteri Matsushita in its slightly larger size, more briefly spined third and fourth antennal segments, and narrower elytral bands, the first extending obliquely from behind scutellum beside another on humerus. Named in honor of Mr. Masaki Matsushita, of Toyohara.

Genus CHLOROPHORUS Chevrolat, 1863

CHLOROPHORUS DEMONACOIDES Gressitt ap. nov. Pinte 1, 0g, 11.

Laterally compressed, slightly narrowed behind; hody black, orange at either side of scutellum, largely clothed with pubescence; head and antennæ sparsely clothed with gray; prothorax largely clothed with grayish green, greenish yellow at each side of basal margin and greenish white beneath; scutellum densely clothed with pale yellow; elytra black, slightly yellowish on basal margin and crossed by fasciæ of greenish yellow, the first extending obliquely from suture slightly behind scutellum to one-third from base, where it turns exteriorly and somewhat anteriorly, not reaching margin, the second transverse, two-thirds from base, broad at suture, narrowing laterally, not

reaching margins, its hind margin straight, the third an oblique apical spot bounded by a line from suture, halfway between second band and apex, to external apical angle, black portions with some adpressed bronzy hairs visible in certain lights; ventral surface grayish below and yellowish at sides; legs moderately clothed with reclining, and a few erect, hairs; some erect pale hairs on head, underside and bases of prothorax, and clytra; antennæ with some internal hairs fused to form false, subapical spines on most of the segments.

Head deep, hardly broader than apex of prothorax, heavily punctured, a few larger and shallower punctures on sides of occiput; antennal insertions distant; frons twice as high as wide, slightly broader apically, a low median carina extending most of its length; genæ fairly long; apical palpal segments broadened and subobliquely truncate apically. Antennæ (female) fine, just over half as long as body; scape small, three times as long as second segment, equal to third; fifth just longer than fourth, shorter than third; remaining shorter than fourth, successively diminishing in length. Prothorax one-fourth longer than broad, hardly narrower at apex than at base, only alightly swollen at sides; surface granulose. Scutellum broadly scutiform. Elytra not quite twice as long as head and prothorax united, slightly broader than prothorax, moderately narrowed posteriorly; transversely subsinuate-truncate apically; base swollen in middle; surface finely punctate. Ventral surface fairly densely and fine-punctured; visible portion of metepisternum hardly broader anteriorly than posteriorly. Legs fairly long, the hind femora extending one-fifth their length beyond elytral apices; middle femora very heavily punctured; hind tarsi with first segment nearly half again as long as remaining united. Length, 12 millimeters; breadth, 3.

Holotype, female, a unique, California Academy of Sciences; Suisha, by Lake Candidius, central Formosa, altitude 750 meters, May 31, 1934.

This species is not closely related to any other species of the genus known to me. It differs structurally from C. signaticallis Chevr. in having the head longer, the antennae finer, more distantly inserted, and with false subapical spines, the prothorax narrower, the scutellum smaller and the hind legs longer; it is very similar in markings to large specimens of Perissus kankauensis Schwarzer. Possibly this species should be placed in

Demonax, because the antennal insertions are rather distant, but the spines on the inner sides of antennal segments are composed of groups of hairs instead of extensions of the segments, and furthermore, the third antennal segment is not longer than the scape.

CHLOROPHORUS MIWAI Grenelit sp. nov. Plate 1, dr. 12.

Cylindrical, parallel; black, largely clothed with dense green pubescence; bead and antennæ green; prothorax green, with a black spot on each side, and a wide, inverted Y-shaped black marking on disc; scutellum green; elytra green, marked with three sets of fasciæ: The first a zerolike mark on basal portion, not touching suture, barely touching hase, and with a short extension along external margin; the second a wide, transverse band at middle, nearly straight behind, and extending anteriorly some distance along suture, another anterior extension joining hind part of zerolike mark at side; the last a large, squarish spot in last third, free from suture and apex, but touching margin; ventral surface clothed with paler green, nearly white on the pleura; legs sparsely clothed with grayish green.

Head higher than wide; from squarish; eyes inverted comma-shaped; antennal insertions fairly close; occiput heavily punctured on sides. Antennæ (female) slightly more than half as long as body; scape slightly arched, barely longer than third segment; fourth slightly shorter than third; following gradually decreasing; most of the segments with a row of fine setze below. Prothorax subglobular, slightly longer than broad, narrower at apex than base. Scutellum slightly narrowed, rounded at apex. Eightra fairly long, slightly narrowed; apices obliquely truncate; hardly toothed at either angle. Legs fairly fine; hind tibize fairly prominently spined internally at apex; hind tarsi with first segment as long as remaining united. Length, 15 to 15.6 millimeters; breadth, 3.6.

Holotype, female, United States National Museum; Rarasan, northern Formosa, altitude 1,750 meters, July 23, 1934; paratype, female, in the author's collection, Hori, Formosa, July, 1934; paratype, male, Tai Kwong, Lam Mo district, Hunan Province, China, July 26 to 28, 1934 (F. K. To), in the collection of the Lingman Natural History Survey and Museum, Canton.

Very similar to C. varius, of Europe, and C. dubius Matsushita, of Formosa, differing from both in having the elytra longer, the

pubescence green instead of yellowish gray or whitish gray, the discal marking of prothorax different, and other characters.

STENASPINI

Genus BUNOTHORAX Gressitt novum

Body strongly compressed dorsoventrally, antenue with basal segments tufted; prothorax 11-noded; elytra tricarinate; legs short.

Head abbreviated anteriorly; from short, vertical; vertex broad, concave, grooved medially; occiput smooth, impunctate; eyes deeply constricted, moderately finely faceted, closely approaching mandibles; genæ minute; palpi short, apical segments compressed, truncate apically. Antenna: (male) half again as long as body, first six segments heavily clothed with long black bristles on apical half, following segments with only a few hairs; scape strongly thickened, shorter than third segment; second longer than broad; third and fourth equal, each slightly shorter than fifth to tenth, which are subequal; last twice as long as third; fourth to ninth subangulate externally at apices. Prothorax nearly twice as broad as long; disc with nine more or less rounded tubercles, one at each side near anterior margin, a pair just before middle, one behind center and two at each side near hind margin; each side also with a strong, blunt tubercle; some large, irregular punctures between, or on sides of, tubercles; surface furnished with long black bristles, as on head. Scutellum equilaterally triangular, subacute, concave basally. Elytra separately produced anteriorly at middle of base; narrow basally, hardly broader than prothorax, very slightly broadened posteriorly, rounded apically; disc with three strongly raised lines, another weaker one between outer two; surface densely and grossly punctate, reticulate, glabrous, a few short black hairs along posterior portions of outer margin. Prosternal process rounded, prominent; mesosternal process narrow, squarish in lateral outline, slightly more prominent anteriorly; middle coxal cavities open externally. Legs short; first segment of hind tarsi less than twice length of second.

Genotype.—Sternoplistes takasagoensis Kano.

Range.—Formosa.

This genus differs from Sternoplistes Guer, in having a much flatter body, shorter, tuberculate prothorax, plumed antenne, more strongly carinate and punctate, and more glabrous, elytra, longer pro- and mesosternal tubercles, and shorter legs.

BUNOTHORAX TAKASAGOENSIS (Kano). Plate 1, 4g. 0.

Sternoplistes takasagounsis Kano, Kontyu (Tokyo) 6 (1983) 278.

Body black, elytra bright red; basal antennal segments with tufts of posteriorly directed black bristles; head and prothorax with erect black bristles; prothorax shiny, with eleven rounded tubercles; elytra nearly naked, strongly punctured and ribbed. Length, 13 to 16 millimeters.

Distribution.—Formosa, Arisan (type locality); Taiheizan, a male in the author's collection, June, 1934.

MESOSINI

Genus SAIMIA Pascoe, 1866

(?) SAIMIA BIRTICORNIS Gressitt sp. nov. Plate 1, fig. 12.

Moderately narrowed, subparallel; antenna very hairy posteriorly. Body black, clothed with pubescence of mottled graybrown, marked with brown, light gray, and ochraceous; head incompletely clothed with pale buff, mottled with darker in front and with a pair of longitudinal dark brown stripes on occiput, and another behind each upper eye lobe; antennæ with scape gray, the following segments pale gray basally and black apically, apical segments largely black, long internal hairs similarly colored, longer and denser posteriorly; prothorax graybrown, spotted anteriorly with ochraceous and with four indistinct dark stripes on disc; elytra whitish gray, dotted with black punctures, crossed by two irregular brown fasciæ, one behind base, the other behind middle, and spotted irregular with ochraceous; undersurfaces densely clothed with gray and ochraceous, reddish on posterior margins of abdominal segments, also some flying gray hairs; legs brown and buff; tarsi with first, second, and last segments light gray basally, black apically, the third entirely black.

Head sparsely punctured; eyes small, the two lobes connected by a fine line; from higher above than below. Antennæ one-fourth longer than body, apical segments and apical portions of basal segments clothed internally with long hairs; scape with an incomplete cicatrix; third segment longer than scape and fourth; following rapidly decreasing in length. Prothorax broader than long, tuberculate anteriorly at sides; disc with five swellings, a pair of elongate ones in the middle and three in a transverse row near base. Scutellum small and narrow. Elytra broad, rounded behind; surface sparsely and heavily punctured. Sternal processes with opposing faces vertical. Length, 13 to 14 millimeters; breadth, 4.5 to 5.

Holotype, female (?). No. 51429, United States National Museum; Hassenzan, Formosa, altitude 1,300 meters, June 21, 1932; two paratopotypes in the author's collection, and a paratopotype in the California Academy of Sciences (Van Dyke collection), June 22 to 26, 1934.

This species differs from S. alternans Schwarzer with its hairy antennæ, the scape and apical segments shorter, its tuber-culate prothoracic disc, and its vertical sternal processes.

HIPPOPSING

Genus PSEUDOCALAMOBIUS Kraatz, 1879

PSEUDOCALAMOBIUS LEPTISSIMUS Greatly op. nov. Plate 1, 62, 14.

Extremely narrow and elongate, antennæ very fine and long, head fully as deep as rest of budy; brown, anterior femora and scape dull reddish brown, rest of antennæ dark brown; head and thorax blackish brown, reddish brown on posterior margin of pronotum, clypeus dark amber, labrum light reddish brown, mandibles and palpi dark reddish brown, elytra dull chocolate-brown, redder at sides, legs and abdomen very dark chocolate-brown; antennæ with basal five segments clothed below with fine erect hairs, rest of body very finely clothed with minute, pale grayish brown hairs, sparser on elytra and denser on midline of pronotum, scutellum, and basal portion of elytral suture.

Head squarish in front, excluding mouth parts, broadest at eyes, slightly broader across genze than at antennal tubercles: vertex fairly deeply concave between antennal tubercles, which are prominent, and swollen internally; from weakly convex, apical margin slightly concave; clypeus short, impunctate; labrum convex, punctulate; palpi with apical segments of each pair swollen basally and acutely attenuate apically. Antenna: two and one-half times as long as body, exceedingly fine; scape cylindrical, reaching well beyond middle of prothorax; second segment barely longer than broad; third segment longer than first and shorter than fourth; fourth to tenth subequal; eleventh nearly double third. Prothorax roughly cylindrical, one-third longer than broad, widest before and behind middle. Scutellum longer than broad, rounded behind. Elytra long and narrow, slightly narrowed posteriorly; apices narrowed externally and produced into a blunt point at suture. Abdomen with first segment nearly twice as long as fourth, others subequal. Logs with femora swollen, hind pair no longer than first abdominal segment. Body largely finely punctured, elytra subscriptely. abdomen most finely, and antenna and lateral portions of metasternum most heavily. Length, 10.5 to 12 millimeters; breadth, 1.5 to 2.

Holotype, female, No. 51428, United States National Museum; Arisan, central Formosa, altitude 2,300 meters, May 23, 1934, three paratopotypes, females, May 23 to 25, and a paratype, male, Taiheizan, northeastern Formosa, altitude 1,800 meters, May 8, 1932, in the author's collection; all collected by the author.

This species differs from *P. filiformis* Fairm, in being smaller and less parallel, in having the antennæ finer and less hairy below, and the elytra acute apically and lacking longitudinal stripes.

Genus METOPOPLECTUS Gressitt novum

Frons trapeziform; head directed posteriorly below; antennæ very long, scape swollen apically; prothorax nontuberculate; anterior coxal cavities closed behind; middle coxal cavities open exteriorly; tarsal claws moderately divergent; form only moderately elongate, narrow in fore body; shoulders prominent; clytra slightly narrowed posteriorly.

Head as broad as prothorax, subacute at apex, nearly twice as broad at genze as at antennal tubercles, which latter are prominent and close; from higher than wide, subparallel; eyes small, almost entire, hardly extending behind antennal supports, not very finely faceted; genæ large; clypeus short; labrum with apical margin slightly concave; palpi with last segment of each pair narrowed and subacute apically. Antennæ two and twothirds to three and one-half times as long as body; scape reaching nearly to posterior margin of prothorax, gradually swollen posteriorly, second segment about as long as broad; third to tenth subequal and nearly as long as first; last longer than two preceding combined. Prothorax cylindrical, one-fourth longer than broad; base hardly broader than apex, two-thirds as broad as elytra. Scutellum as long as broad, rounded behind. Elytra very slightly narrowed in basal three-fourths; apices fairly abruptly narrowed, and narrowly rounded, or subtruncate, at Abdomen with first segment not quite as long as following two united. Legs short; femora moderately swollen; hind pair reaching to middle of abdomen; middle tibiæ obliquely grooved exteriorly; tarsi nearly as long as tibiæ, the hind pair with the first segment barely as long as the following two united, last longest.

Genotype.—Metopoplectus taiwanensis Gressitt sp. nov. Range.—Formosa and eastern China.

This genus is established for the following new species, as well as for *Cleptometopus orientalis* Mitono and an undescribed species from China.

Differs from Cleptometopus Thomson in being broader, in having the head shorter and less acute, the frons broader, the scape more swollen apically, the succeeding antennal segments lacking long apical hairs, the prothorax being less elongate and less narrowed apically, the elytra less attenuated, less heavily punctured basally, and not spined posteriorly, their surface with concave areas; and from Pothyne in having the superior lobes of eyes lacking, the antennæ much less hairy, the scape swollen, the prothorax narrower, and the clytra shorter. The form is less linear than in most Hippopsini, the elytra being considerably broader than the head and prothorax.

METOPOPLECIUS PAIWANENSIS Greenitt op. nov. Plate 1, dg. 16.

Largely dull chocolate-brown, elytra partly very light brown, body clothed below with short grayish brown hairs and above with dark chocolate, and light tawny brown, hairs; front of head slightly reddish brown with a few pale hairs, thicker at sides; occiput blackish brown with a narrow midlongitudinal stripe of tawny hairs, and similar clothing behind eyes; antennæ with scape reddish brown on basal two-thirds, the apex blackish, remaining segments light brown basally, and dark chocolatebrown apically; prothorax with a median, and two lateral, broad, longitudinal tawny stripes; scutellum tawny; elytra dark brown basally, a few oblique pale stripes extending from basal portion of disc, humerus, and lateral margin, converging and meeting suture before middle, then an oblique dark brown area, irregular posteriorly and broader at suture, along which it extends posteriorly, joining inner one of two longitudinal subapical dark stripes, inner one not adjacent to suture, extreme apex dark, intervening postmedian and subapical areas pale brown.

Head fairly densely and finely punctured, not quite as broad near apices of genæ as at eyes, much narrower across antennal tubercles; eyes small, entire, very slightly longer than broad, rounded below and bluntly angulate above. Antennæ three to three and one-half times as long as body; scape swollen apically, very slightly longer than third segment; third to tenth subequal, last very long; five basal segments sparsely clothed below with short fine hairs. Prothorax barely longer than broad, very slightly swollen in middle; basal two-thirds as broad as elytra; surface fairly densely, and finely, punctured. Elytra very slightly narrowed in basal three-fourths; apices narrowly rounded at

suture; surface fairly densely, and moderately heavily, punctured in twelve or more rows, less heavily so posteriorly. Ventral surface moderately punctured, more heavily on sides of metasternum and more finely on abdomen. Length, 9.5 to 10.3 millimeters; breadth, 2.2 to 2.5.

Holotype, female, No. 51430, United States National Museum; Sakaben, northeastern Formosa, altitude 1,100 meters, July 16, 1934; allotype, male, Hori, central Formosa, at about 600 meters, June 9, 1934, in the author's collection; both taken by the author.

Differs from *M. orientalis* (Mitono) in its smaller size, its more swollen, and more arched, antennal scape, its less cylindrical prothorax, its rounded, instead of subacute, clytral apices, and its strongly punctured metasternum. The elytra are also less densely punctured than in the latter.

Genus ARISANIA Gressitt novum

Elongate, parallel-sided, cylindrical; from narrow, broadest at antennal tubercles, which are very prominent; antennæ twice as long as body; pronotum with a small tubercle at each side; anterior come subglobular, separate, closed behind; middle coxal cavities open exteriorly; middle tibiæ grooved externally; legs short, hind femora nearly as long as first two abdominal segments, tarsal claws divaricate; elytra long, rounded-truncate apically.

Head as broad as prothorax, higher than wide, directed slightly posteriorly below; eyes moderately narrow and long, very narrowly constricted behind antennal supports, ventral lobe large, fairly closely approaching mandibles, dorsal lobe minute; antennal tubercles large and very prominent, contiguous basally, diverging at an angle of 100°; from higher than wide, broadest at antennal supports, subparallel below, swollen; clypeus short; labrum longer than clypeus, more than half as long as broad, punctulate; mandibles short, very thick basally; genæ minute; palpi with the apical segment of each pair subfusiform, thickened basally and truncate apically. Antennæ two and one-half times as long as body in male, twice as long in female; scape reaching to about middle of prothorax, subcylindrical, narrow at base, thickest before apex, external apical margin slightly emarginate; second segment broader than long; third to seventh segments subequal, cylindrical, progressively slightly longer and finer; last four segments shorter and finer; last longer than tenth, shorter Prothorax as long as broad, broader at apex than than third. at base; slightly constricted before the base, furnished with a

short, conical tubercle at each side, slightly behind middle; a slight swelling behind middle of disc; middle of posterior margin Scutellum nearly as long as broad, rounded truncate behind. Elytra long, parallel, slightly constricted before middie, very slightly narrowed and subobliquely truncated at apices; surface subscripte-punctate. Anterior coxe prominent, subglobose, their cavities angulate externally, separate, closed behind; middle coxx less prominent, their cavities open externally to epimera; metasternum swollen at sides and abruptly declivitous apically; metepisternum narrowed posteriorly. Abdomen with last segment as long as first; second, third, and fourth successively shorter; last segment slightly emarginate below at apex in male, concave in apical half in female. Legs short, femora moderately swollen; tarsi as long as tibiæ, first segment of hind pair not as long as following two segments combined, claws divaricate.

Genotype.—Arisania submarmorata Gressitt sp. nov.

Range.—Formosa (central).

This genus is doubtfully placed in the Hippopsini, differing from the characteristic genera in having the frons narrowed apically, the antennæ not ciliate below, except for scape, the prothorax with a small tubercle at each side, and the tarsal claws divaricate. Differs in form from Pseudocalamobius in being broader and more cylindrical, with the antennæ thicker, and shorter in the male.

ARISANIA SUBMARMORATA Gresslet sp. nov. Plate 1, 6g. 16.

Elongate, parallel; elytra two and one-half times as long as head and prothorax united; from narrowed apically; antennal tubercles prominent; prothorax slightly tuberculate laterally; hind femora hardly reaching to end of second abdominal segment.

Reddish brown, blackish on front of head, middle of prothorax and ventral surface of body; body largely covered with short, recumbent brown hairs, forming motiled patterns: antennæ poorly clothed, scape only with very short, fine, erect hairs below; head, prothorax, and scutelium with light rusty brown hairs, an irregular naked patch in middle of disc of latter; elytra with a small, irregular, subbasal, discal spot and the apical third largely light rusty brown, a short, transverse, hairless band preceding the latter area, anterior three-fifths thinly and irregularly clothed with small spots of grayish brown bair; ventral surface grayish brown, sides of metalhorax, apical segments, and sides

1

of basal segments, of abdomen irregularly rusty. Length, 7.5 to 10.5 millimeters; breadth, 1.5 to 2.5.

Holotype, male, No. 51431, United States National Museum; Arisan, Formosa, altitude 2,250 meters, June 4, 1932, allotopotype female, and 3 male paratopotypes in the author's collection, all taken the same day by the author.

The middle portion of each antennal segment is pale in the female.

Genus OBEREA Mulsant, 1839

OBERBA BREVITAORAX Gressitt sp. nov. Plate 1, Sg. 17.

Elongate, prothorax short, clytra long, narrowed after basal third and slightly expanded preapically; head and antennæ pitch black, except for amber-colored clypeus and pale orange palpi; prothorax pale orange below, duller orange above with a very small black spot at each side near base; scutellum brownish black; elytra grayish black along suture and shiny black on shoulders, sides, and apices, yellow on middle of basal margin and with a walnut brown stripe along middle of disc to near apex, dotted with black punctures, subhumeral areas orange; ventral surface orange, except for black metepisternum, posterior three-fourths of metasternum, lateral margin of first, sides of second and third, and all but base of fifth, abdominal segments, hind tibiæ, external margins of anterior and middle tibiæ and tarsi above, except for base of third segment and large part of last, which is brown. Forebody and underside clothed with short, reclining hairs and longer and sparser erect pale or golden hairs, those on last abdominal segment and the erect ones on head black, elytra with pale reclining bairs on inner black portion and some creet ones on basal portion, the brown stripe nearly naked, shiny.

Head strongly swollen in front, very slightly concave on vertex, fairly heavily punctured except on posterior portion of occiput; eyes large, deeply constricted, ventral lobe broader than long, closely approaching mandibles. Antennæ (female) reaching to last fifth of elytra, all segments except second subequal in length. Prothorax very short, two-thirds as long as broad, hardly as broad as elytra at base, swollen above and with a raised area at each side; surface irregularly punctured, more sparsely on center of disc. Scutellum short, its posterior margin transverse. Elytra fully four times as long as head and prothorax united, narrowed and subparallel after first quarter, slightly expanded in last fifth; apices obliquely emarginate internally, with a small tooth at suture and a larger one at exter-

nal angle; surface with six longitudinal rows of large punctures. Mesepisternum punderately punctured, narrowed and raised above; metepisternum heavily punctured; metasternum punctured moderately at sides, more finely anteriorly; abdominal segments slightly punctured at sides. Legs short, hind femora reaching but slightly beyond end of first abdominal segment. Length, 19 millimeters; breadth, 2.5.

Holotype, female, California Academy of Sciences; Hori, Formosa, altitude 500 meters, June 9, 1934; collected by the author.

This species differs from O. binotaticollis Pic in having the prothorax short, the clytra much more attenuate, more oblique at the apices, more heavily punctured, relatively naked and partly brown, and the last abdominal segment shiny black except at base; it differs from O. holoxantha formosana Pic in having the head broader, the prothorax much shorter, and the elytra more attempate, besides being largely black and brown.

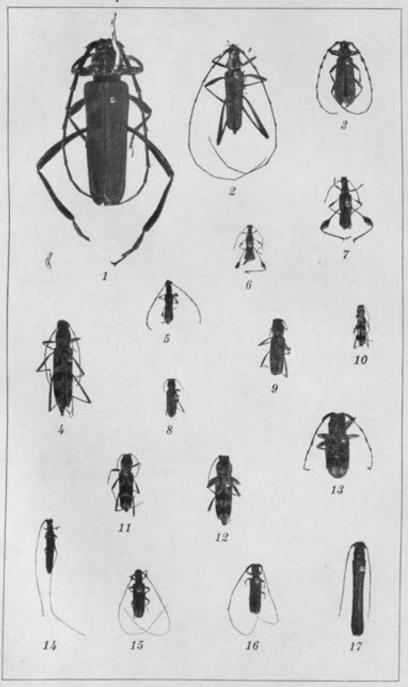

PLATE 1.

NEW OR LITTLE-KNOWN TIPULIDÆ FROM EASTERN ASIA (DIPTERA), XXXIII

By CHARLES P. ALEXANDER Of Amberol, Massachusette

TWO PLATES

Virtually all of the species of crane flies herein discussed are from Hainan island where they were collected in 1935 by Mr. J. Linsley Gressitt. A few additional species are from the Khasi Hills, Assam, secured by Mr. S. Sirear and associated entomologists. All the types of novelties described at this time are preserved in my very extensive collection of these flies. I wish to express my very deepest thanks to the above-mentioned entomologists for their friendly cooperation in continuing this study of the Tipulidæ of southeastern Asia.

The rather extensive collections made in Hainau proved to be of exceptional interest, since virtually nothing had been made known of this rich faunal area. I am indebted to Mr. Gressitt for the following notes concerning various collecting stations at which Tipulidæ were secured;

TA HIAN. Altitude 2,000 feet, by stream, near northwestern foot of the Five Finger Mountains, south of the middle of the island; 10 miles south of Fan Heang.

TA HAN. Altitude 2,500 feet; small valley between passes of the Loi Mother Ranges and the Red Mist (Hung Mo) Range; on way from Nodoa to the Five Finger Mountains, about 20 miles north of Ta Hian.

TA HAU. Altitude about 900 feet; a small village near Vo Lau, in Dam-Chui, west and slightly south of Nodoa about 30 miles; flat country.

Nonoa (Notat). Altitude about 1,000 feet; flat country, in the northwest-central part of the island.

FAN TA. Allitude about 1,250 feet: 22 miles south of Nodoa; beginning of low mountains.

CHUNG KON. Altitude about 1,050 feet; between Nodea and Loi Mother Mountain, near Deng-ag River.

496—- 8

Contribution from the entomological laboratory, Massachusetts State
 College.

Dwa Bi (Tai Pin). Altitude about 1,500 feet, at foot of north end of Loi Mother Range; about 20 miles west and slightly north of Liamui, near the center of the island.

LIAMUI. Altitude about 1,200 feet, near the eastern edge of mountains on a low plateau, with mountains on its east, between it and the great northern plain. From the hills around can be seen the Loi Mother Mountain, Red Mist Mountain, and the Five Fingers, to the west and southwest.

Besides the score of species of Tipulidæ described as new in the present report, Mr. Gressitt secured a number of additional crane flies that are recorded herewith to complete the data.

LIMONIA (RHIPIDIA) PULCHRA (de Meljere).

Ta Hian, June 13, 1935,

LIMONIA (GERANOMYIA) ARCENTIFERA (de Meijore).

Ta Hian, June 14, 1935; Ta Han, June 7, 1935; Liamui July 31, 1985.

LIMONIA (THRYPTICOMYIA) APICALIS (Wiedemann).

Ta Hian, June 11, 1935; Ta Han, June 22 and 23, 1935.

CONOSIA IRRORATA (Wiedemann).

Ta Hian, June 15 to 18, 1935; Ta Han, June 22 to 24, 1935; Ta Hau, July 3, 1935; Nodoa, June 30, 1935; Chung Kon, July 17, 1935.

TRENTEPOULIA (MONGOMA) PENNIPES (Osien Sacken).

Chung Kon, July 18, 1935.

TRENTEPORLIA (TRENTEPORLIA) PICTIPENNIS Bessio

Ta Hian, June 11, 1935; Ta Han, June 21, 1935.

TRENTEPOHLIA (TRENTEPOHLIA) TRENTEPOHLII (Wiedemann).

Ta Hian, June 11, 1935; Nodoa, June 20, 1935; Liamui, July 2, 1935; Ta Han, July 4, 1935; Chung Kon, July 18, 1935; Dwa Bi, July 21, 1935.

GONOMYIA (LIPOPHLEPS) BICOLORATA Alexander.

Ta Han, June 23, 1935. Known hitherto only from Luzon.

GONOMYIA (LIPOPHLEPS) INCOMPLETA Brunctil.

Ta Hian, June 14, 1935; Ta Hau, July 3, 1935; Chung Kon, July 18, 1935; Dwa Bi, July 20, 1935.

TIPULINÆ

LONGURIO HAINANENSIS sp. nor. Plate I. ag. t.

General coloration of mesonotum and abdomen yellow and orange; head variegated with brownish black on lateral por-

tions of posterior vertex; wings narrow, tinged with gray; Rs short and arcuated, much shorter than $R_{2,3}$; m-cu a short distance before fork of $M_{3,4}$.

Female.--Length, about 20 millimeters; wing, 15.

Frontal prolongation of head yellowish white; nasus conspicuous, black; paipi black. Antennæ dark brown throughout, very small, if bent backward searcely extending beyond the posterior border of head; flagellar segments cylindrical, with long, conspicuous verticils. Head whitish on front and anterior vertex, the central portion of posterior vertex and occiput yellow, the lateral portions of latter, together with the posterior orbits, brownish black.

Pronotum and propleura black. Mesonotum almost uniformly yellow, restrictedly variegated by darker, including the lateral ends of suture, margins of parascutella, and posterior border of mediclergite. Pleura obscure yellow, the posterior border of dorsopleural membrane with a conspicuous velvety black area; posterior portion of pleurotergal tubercle a little darkened. Halteres dirty white, the knobs darkened. Legs with the coxæ yellowish testaceous; trochanters whitened; remainder of legs brownish black. Wings (Plate 1, fig. 1) narrow, subhyaline or with a faint grayish tinge; stigma and cell Sc a little darker; veins brown. Macrotrichia on outer portions of veins R_2 and $R_{4.6}$; trichia on outer medial branches lacking or reduced to one or two scattered setæ. Venation: Rs short and arcuated, much shorter than $R_{2.6}$; distal end of Sc, atrophied; m-cu a short distance before fork of $M_{3.4}$; cell 2d A relatively wide.

Abdominal tergites orange-yellow, the incisures restrictedly paler; intermediate tergites with vague medial darkenings, on outer segments more evident and suffusing the caudal borders of the segments; sternites more yellowish, with a more or less distinct brown median stripe; pleural membrane infuscated. Ovipositor with small and inconspicuous, blunt valves.

Habitat.-China (Hainan Island).

Holotype, female, Dwa Bi, altitude about 1,500 feet, July 20, 1935 (Gressitt).

Langurio hainanensis is readily told from the four species hitherto described from China and Japan by the narrow, subhyaline wings, with Rs unusually short and arcuated. The most similar of the above-mentioned forms is L. fulrus Edwards (China, Formosa). I am not fully convinced that Sphærionotus de Meijere can be maintained as a genus distinct from Longurio Loew.

NEPHROTOMA HAINANICA sp. nov. Plate 1, fig. 2.

General coloration yellow, patterned with black; frontal prolongation of head darkened on sides; head orange, with no occipital brand; mesonotal præscutum with three polished black stripes that are narrowly bordered by velvety black, the central portion of median stripe paler on anterior half; scutellum, postnotum, and pleura yellow; wings with a faint dusky tinge, the stigma and cells Sc and Cu₁ darker; Sc₂ ending a short distance beyond origin of Rs, the latter subequal in length to R_{2.3}; cell M, broadly sessile; abdominal tergites weakly infuscated medially, the disk of the seventh tergite intensely blackened,

Female.—Length, about 14 millimeters; wing, 11.

Frontal prolongation of head light yellow above, dark brown on sides; nasus black, conspicuous. Antennæ with the scape brown; pedicel dark brown; flagellum black. Head orange; vertical tubercle very weakly notched; no differentiated occipital brand.

Pronotom and pleura orange-yellow. Mesonotal præscutum yellow with three polished black stripes, all narrowly bordered by velvety black; anterior end of median stripe with its central portion yellow, this pale color continued caudad for nearly onehalf the length of the stripe; lateral stripes straight; scutum yellow, each lobe with two confluent polished black areas that are very narrowly bordered by velvety black; lateral ends of transverse suture infumed; scutellum and mediotergite yellow, without darkening, the latter with delicate setulæ on posterior lateral portions. Pleura yellow, variegated by more reddish yellow areas on the propleura, anepisternum, ventral sternopleurite, and meron. Halteres dusky, the base of stem restrictedly pale. Legs with the coxe and trochanters yellow, the fore coxe more reddish yellow; femora brownish yellow, somewhat clearer yellow at base, a little more darkened outwardly; tibiæ and tarsi brownish black to black. Wings (Plate t, fig. 2) with a faint dusky tinge; stigma cell Sc, and the narrow cell Cu, infuscated; wing tip very gradually and insensibly darker than the remaining ground color of the membrane; veins dark brown. Stigmal trichia few. Venation: Sc, entirely preserved, Sc, ending a short distance beyond the origin of Rs, the latter subequal in length to R_{2,0} cell M₄ broadly sessile; m-cu at point of departure of vein M₄.

Abdominal tergites weakly infuscated medially, somewhat paler sublaterally at bases of segments; disk of seventh tergite intensely blackened, the borders yellow, the lateral margins more broadly so; sternites more uniformly yellow. Ovipositor with genital shield obscure yellow; cerci nearly straight.

Habitat.-China (Hainan Island).

Holotype, female, Ta Han, altitude 2,500 feet, June 22, 1935 (Gressitt).

The thoracic pattern, especially the highly polished præsental stripes that are narrowly margined with velvety black, is much as in Nephrotoma siamensis Edwards, which differs conspicuously in the occipital brand, black central præsental vitta, dull black scutellum and apical third of mediotergite, and numerous other features. The coloration of the median præsental stripe is approached by the otherwise very different Formosan species, N. parva Edwards.

CYLINDROTOMINÆ

CHALACROCERA TARSALBA sp. nov. Plote 1. fig. 3.

Front and anterior vertex silvery white, posterior vertex black; prothorax light yellow; mesonotum almost uniformly black; pleura yellow; legs darkened, the tarsi chiefly snowy white; wings narrow, the prearcular region petiolate; m-cu at fork of M; cell 2d A reduced to a narrow strip; abdominal tergites black, the sternites more greenish brown; ovipositor and genital segment brownish yellow.

Female.—Length, about 8 millimeters; wing, 8.

Rostrum yellow, palpi dark brown. Antennæ relatively short; scape and pedicel yellow, flagellum brownish black; flagellar segments passing into cylindrical, with verticils that much exceed the segments; terminal segment about one-half longer than the penultimate. Front and anterior vertex broad, silvery white; posterior vertex black, the occiput paling to dull yellow.

Prothorax entirely light yellow. Mesonotum almost uniformly black, greatly restricting the obscure yellow ground colors; præscutum with three confluent stripes, the yellow ground reduced to narrow humeral triangles; median regions of scutum and scutellum restrictedly pale; mediatergite narrowly margined with yellow, the disk black. Pleura and pleurotergite, together with the pleural membranes, uniformly pale yellow. Halteres dusky, the knobs infuscated, the base of stem restrictedly yellow. Legs with the coxæ and trochanters yellow; femora greenish basally, the tips gradually passing into brown; tibiæ brown, the tips darker; tarsi snowy white, the proximal ends of basitarsi blackened. (All legs are detached and the degree of blackening differs in the various legs; in some, only

the extreme tip, the distal fifth or sixth, is whitened, while in one pair, which is presumably the posterior one, the white includes the distal three-fifths.) Wings (Plate 1, fig. 3) with a weak brown tinge; stigma small, long-oval, dark brown; veins dark brown, the prearcular veins more yellowish brown. Wings with a long basal petiole. Venation: Sc₁ atrophied; Sc₂ ending just beyond fork of Rs, the free tip evident as a faint trace at near midlength of the stigma, m-cu at fork of M; cell 2d A reduced to a narrow strip.

Abdominal tergites black; sternites more greenish brown; ovipositor and genital segment brownish yellow.

Habitat.—China (Hainan Island).

Holotype, female, Ta Han, altitude 2,500 feet, June 25, 1935 (*Gressitt*). Paratopotypes, 1 female, I (sex?), June 21 and 22, 1935.

Phalacrocora tarsalba is readily told from all other allies in eastern Asia by the unusually narrow, petiolate wings, very narrow cell 2d A, and the snowy white tarsi. It has no close relative so far made known, the most similar form being P. minuticornis Alexander (western China). The discovery of a Palæarctic element such as the genus Phalacrocera at relatively low altitudes in Hainan has provided a surprise in geographic distribution.

L/MONINÆ

Genus LIMONIA Meigen

Limonia MEIGEN, Illiger's Magazin 2 (1803) 262.

Subgenus CRESSITTOMYIA novum

Characters as in typical Limonia, differing most evidently in details of wing venation.

Antennæ 15-segmented; flagellar segments oval, the longest verticils unilaterally distributed on outer face, about one-third longer than the segments; terminal segment slender, about two-thirds the length of the penultimate. Anterior vertex narrower than the diameter of the scape. Claws with a single short spine near base. Wings (Plate 1, fig. 4) with Sc moderately long, Sc, ending beyond two-thirds the length of Rs, Sc₂ close to its tip; Sc₂ + R, gradually bent strongly caudad, at its outer end reducing vein R₂ to a short hyaline element, the free tip of Sc₂ correspondingly lengthened but entirely pale; a supernumerary crossvein in cell R₂ at near midlength; vein R₃ beyond the cross-

vein strongly siduous, slightly constricting cell R_8 at near midlength; a long fusion of veins $R_{4.5}$ and $M_{1.2}$, nearly equal in length to R_8 , completely obliterating r-m; cell 1st M_2 narrowed to a point at outer end, m being very short to nearly obliterated; outer medial veins deflected strongly caudad; m-cu at or close to fork of M_1 cell M_2 at margin unusually wide; anal veins nearly straight, parallel at origin. Male hypopygium (Plate 2, fig. 25) with the dorsal dististyle, dd_1 well developed, slender. Ventral dististyle, vd_1 small, with a long, slender, rostral prolongation that boars two, long, slender spines on a small tubercle at base; face of style bearing a larger and more conspicuous tubercle that has three, very long, slender setze, these exceeding in length the rostral prolongation of the style.

Type of subgenus.—Limonia (Gressittomyin) renoptera ap. nov. (Oriental Region; Eastern China, Hainan Island.)

The crane fly discussed under the above name is one of the strangest in appearance that has ever come to my attention. At first sight the venation seems quite irreconcilable with that of members of the genus Limonia, the veins beyond the cord being unusually complicated by fusions of elements and the presence of a supernumerary crossvein in cell R₃. However, there is no doubt that the fly is a member of the great genus Limonia and that it is necessary to erect a new subgeneric group for its reception. I take great pleasure in dedicating this subgenus to Mr. J. Linsley Gressitt, who has added materially to our knowledge of the Tipulidæ of eastern Asia.

The most unusual character of the group and the one that separates it from all other subgenera of Limonia is the profound fusion of veins R4.5 and M1.2, a character suggested by certain other species of the genus, as Limonia (Laosa) gloriosa (Edwards) where the contact of veins R4.5 and M4.2 is merely punctiform. Elsewhere in the Tipulidæ such a long fusion of veins R4.5 and M1.2 is rare, being most evident in the tipuline genus Ptilogyna Westwood and in the limoniine genus Trentepohlia Bigot. In other groups of the Limonijnæ, a fusion of this nature occurs sporadically in genera such as Helius St. Fargeau and Tencholabis Osten Sacken, but throughout the entire family Tipulida its occurrence must be held to be decidedly uncommon. The presence of a supernumerary crossvein in the outer radial field is a character likewise possessed by three other subgenera of Limonia; namely, Laosa Edwards, Dapanoptera Westwood. and Neolimnobia Alexander. The group most nearly allied to Gressittomyia would seem to be Luosa. For additional details and comparisons the discussion of the subgenera of Limonia as given by the writer in an earlier paper 2 may be consulted.

LIMONIA (GRESSITTOMYIA) XENOPTERA sp. nov. Plate 1, fig. 4: Plate 2, fig. 25.

General coloration orange; antennæ with scape and pedicel black, the flagellum obscure yellow, its outer segments more darkened; head silvery gray, with a capillary dark line on posterior vertex; halteres yellow, the knobs darkened; legs yellow, the femoral tips rather broadly blackened; wings hyaline, the prearcular and costal fields more yellowish, the outer radial, cubital, and anal fields more bully; veins beyond cord conspicuously seamed with brownish black; $R_{4,5}$ extensively fused with $M_{5,2}$; m very short to virtually lacking; male hypopygium with the rostral spines slender, from a common tubercle at base of prolongation.

Male.—Length, about 7 millimeters; wing, 8.2.

Rostrum and palpi black. Antennæ with scape and pedicel black; flagellum obscure yellow, the outer segments passing into brownish yellow; antennal structure as described under subgenus. Head silvery gray, with narrow black median line on posterior vertex.

Entire thorax orange, immaculate. Halteres yellow, the knobs dark brown. Legs yellow, the femoral tips rather broadly black, the amount subequal on all legs; outer tarsal segments infumed. Wings (Plate I, fig. 4) hyaline, the prearcular region and cells C. Sc. and R light yellow; outer portion of cell R, cell 1st M_{\odot} and base of R_{\odot} , with outer ends of cells Cu, 1st A, and 2d A, together with basal portion of Cu more buffy; veins beyond cord narrowly but conspicuously seamed with brownish black; veins black in the outer fields, paler in the cells basad of cord. Venation as described under the subgenus; second section of vein $R_{\rm CC}$ subequal in length to the second section of $M_{\rm CC}$; Vein Cu_2 lying unusually far distant from vein Cu_1 .

Abdomen, including hypopygium, deep orange, the pleural membrane weakly infumed; ventral dististyic of hypopygium infuscated. Male hypopygium (Plate 2, fig. 25) with the caudal margin of tergite, 9t, transverse or very gently emarginate, the sete at and near border. Basistyle, b, with ventromesal lobe large. Dorsal dististyle, dd, a slender blackened book, the acute tip slightly decurved. Ventral dististyle, vd, with the body small, shorter than the dorsal dististyle, its rostral prolongation long

^a Philip. Journ. Sci. 40 (1929) 239-248.

and slender. Mesal-apical lobe of gonapophyses very slender. Ædeagus broad at base, narrowed to the bilobed apex.

Habitat.—China (Hainan Island).

Holotype, male, Ta Han, altitude 2,500 feet, June 22, 1935 (Gressitt).

The species requires no comparison with any other known member of the genus.

LIMONIA (LIMONIA) CALCARIFERA in may, Plate 1, flz. 5.

General coloration obscure yellow, the prescutum darkened medially; flagellar segments gradually lengthened to the outermost; eyes broadly contiguous, ommatidia relatively coarse; pleara obscure yellow, variegated by darkened areas; femora yellow, the tips black; wings cream-colored, the base and costal portion clearer yellow; a restricted dark pattern, including the small stigma and a cloud at origin of Rs; Sc relatively long; Rs angulated and short-spurred at origin; m-cu at fork of M; anal veius convergent basally; abdominal tergites light brown; apices of cerei simple.

Female.—Length, about 7 millimeters; wing, 6.8.

Rostrum brown, palpi a little darker. Antennæ dark brown throughout; basal flagellar segments short-oval, the outer ones passing through oval to subcylindrical, becoming progressively longer outwardly; terminal segment pointed on distal end, about a fifth longer than the penultimate; extreme apex of flagellar segments glabrous and forming a pedicel, but not suddenly narrowed into a neck; verticils of outer segments subequal to or a trifle longer than the segments. Eyes broadly contiguous on anterior vertex; ommatidia relatively large and coarse; posterior vertex brownish gray.

Pronotum brown. Mesonotal præscutum obscure yellow, more infuseated medially; lateral stripes little or scarsely evident; selæ of interspaces erect and unusually long; præscutum with a weak, median impressed line, best developed on posterior half; scutal lobes dark brown, median area broadly obscure yellow; scutellum obscure yellow on basal portion, the posterior margin broadly infuscated, weakly pruinose; mediotergite dark brown, paler on lateral portions. Pleura obscure yellow, the propleura, anepisternum, and dorsal sternopleurite slightly infuscated. Halteres pale basally, the outer end of stem and the knobs infumed. Legs with the coxe and trochanters testaceous-yellow; femora yellow, the tips rather broadly and conspicuously blackened; tibiæ yellowish brown, the tips narrowly and gradually darkened; tarsi passing into brownish black. Wings (Plate 1,

fig. 5) with the ground color somewhat creamy, the prearcular region and cells C and Sc clearer yellow; stigma subcircular, brown; a very restricted, scarcely evident, dark pattern, appearing as small clouds at origin of Rs and fork of Sc, and as a very narrow and vague apical darkening; cord and outer end of cell 1st M₂ very slightly darkened, most evident as a deepening in the intensity of the veins; veins yellow, darker beyond cord and in the clouded areas. Venation: Sc relatively long, Sc, ending about opposite four-fifths the length of Rs, Sc₂ near its tip; Rs weakly angulated and spurred near origin; free tip of Sc₂ and R₂ in transverse alignment; cell 1st M₂ widened outwardly, m about one-half the basal section of M₃; m-cu at fork of M; anal veins convergent basally, 2d A very gently sinuous.

Abdominal tergites light brown, scarcely variegated with darker; sternites more yellowish. Ovipositor with valves reddish horn-color, the bases of the hypovalvæ blackened; cerci upcurved and acute at tips.

Habitat.—China (Hainan Island).

Holotype, female, Dwa Bi, altitude about 1,500 feet, July 22, 1935 (Gressitt).

The general appearance of the present fly indicates that it is a member of the pendleburyi group. It differs from the typical form of this group, Limonia (Limonia) pendleburyi Edwards, of the Federated Malay States, and allied species, in the coloration of the body, legs, and wings and in the details of venation. The angulated and spurred Rs is a peculiar feature in the present group of flies.

LIMONIA (LIENOTES) QUINQUE-COSTATA sp. nov. Plate I. Sr. s.

General coloration brownish yellow, the prescutum with four darker brown stripes; antennæ black throughout; thoracic pleura brownish yellow, variegated by blackened areas; knobs of halteres dark brown; femora brownish black, the tips narrowly and abruptly yellow; tibiæ and tarsi black; wings cream-yellow, with a restricted dark pattern, including five small areas along costal border; free tip of Sc₂ and R, in approximate transverse alignment; anal veins strongly convergent; cerci bidentate at tips.

Female.-Length, about 10 millimeters; wing, 9.

Rostrum obscure brownish yellow; palpi black. Antennæ black throughout; basal flagellar segments globular, passing through short-oval to elongate; terminal segment about onehalf longer than the penultimate; longest verticils exceeding the segments. Front and anterior vertex buffy, the posterior portion of head more fulvous; anterior vertex reduced to a narrow strip that is only a little wider than the diameter of a single ommatidium.

Pronotum dark brown above, brownish yellow on sides. Mesonotal præscutum brownish yellow, the humeral region clear yellow; four darker brown præscutal stripes, the intermediate pair entirely confluent on anterior third of sclerite; a narrow blackish area borders internally the yellowish humeral portion of sclerite; scutal lobes dark brown, the median region more grayish; scutellum pale; mediotergite light gray, a trifle paler medially, more darkened on sides. Pleura brownish yellow, varicgated by blackened areas on ventral propleura, dorsopleural membrane, ventral anepisternum, and dorsal sternopleurite. Halteres relatively long, the stem yellow, the knob dark brown. Legs slender; fore coxe dark brown, the middle and hind coxe yellow; femora obscure yellow basally, gradually deepening to brownish black, the tips narrowly but conspicuously yellow, the amount subequal on all legs; tibiæ and tarsi black. Wings (Plate 1, fig. 6) with the ground color cream-yellow, with a restricted brown pattern that is confined to the vicinity of the veins, including a series of five costal areas, distributed as follows: Arculus; cell Sc at near one-third the distance to Rs; origin of Rs; fork of Sc; and the small circular stigmal area on vein R₁₋₂, only slightly invading R₂; additional dark seams to many of the veins, including the cord, outer end of cell 1st M2, more than the basal half of vein R2.3, and outer end of vein 2d A; veins yellow, darkened in the clouded areas. Venation: Sc, ending beyond level of m-cu, Sc₂ at its tip; Rs very gently arcuated about four times the basal section of $R_{4.5}$; free tip of Se₂ lying shortly proximad of R₂; cell 1st M₂ of moderate length; m and basal section of M2 subequal; m-cu at near onethird the length of cell 1st M2; outer radial and medial veins nearly straight or only gently curved; anal veins strongly convergent.

Abdominal tergites chiefly dark brown, the caudal portions of the segments a little more reddish brown; sternites brighter. Cerci stout, bidentate at tips.

Habitat.—China (Hainan Island).

Holotype, female, Ta Haan, altitude 2,500 feet, June 21, 1935 (Gressitt).

By Edward's key to the species of Libnotes,^a the present fly runs to couplet 33, differing markedly from all species in the wing pattern and leg coloration. It runs more or less directly to Limonia (Libnotes) longinervis (Brunetti), an entirely different species.

ANTOCHA (ANTOCHA) FLAVIOULA sp. nov. Plate 1, fig. 7; Plote 2, fig. 26.

Size small (wing, male, 3.5 millimeters); head light gray; antennæ short, flageilum black; thorax and abdomen light yellow; halteres pale yellow; femora yellow, the tips narrowly and gradually infuscated; wings cream-colored, with a restricted, pale brown clouded pattern; m-cu more than one-fourth its length before the fork of M; male hypopygium with the outer dististyle suddenly narrowed at apex into an acute black spine.

Male.—Length, about 3.5 millimeters; wing, 3.5.

Rostrum obscure yellow; palpi a trifle darker. Antennæ short; scape and pedicel yellowish brown, flagellum black; flagellar segments small, subglobular to short-oval, the outer ones becoming more clongate. Head light gray.

Entire thorax light yellow. Halteres pale yellow. Legs with the coxe and trochanters yellow; femora yellow, the tips narrowly and gradually infuscated; tibiæ pale brown, the tips slightly darker; tarsi infuscated. Wings (Plate I, fig. 7) cream-colored, with a vague but evident pale brown pattern, distributed as clouds at origin of Rs, stigma, along cord and outer end of cell 1st M₂, and at the outer ends of veins R₃ and 1st A; veins yellow, pale brown in the clouded areas. Veins behind R₁ entirely glabrous. Venation: Sc relatively long, Sc₁ ending some distance beyond the fork of Rs; R₂ in virtual transverse alignment with r-m; cell 1st M₂ about as long as vein M₃ beyond it; basal section of M₃ longer than m; m-cu more than one-fourth its length before the fork of M.

Abdomen, including hypopygium, yellow. Male hypopygium (Plate 2, fig. 26) with the tergite narrowly transverse, the caudal margin approximately straight across or with the median portion a little projecting. Outer dististyle, od. relatively long and stender, at apex suddenly narrowed into an acute darkened spine. Inner dististyle broader, the apex obtuse. Phallosome, p, subtended on either side by a flattened, very pale plate, the apex of which is obtusely rounded. Outer gonapophysis, g, a simple slender rod, gradually narrowed to an acute point.

Habitat.-China (Hainan Island).

Journ. Fed. Maloy St. Mus. 14 (1928) 74-80.

Holotype, male, Dwa Bi, altitude about 1,500 feet, July 21, 1935 (Gressitt).

The present species is most closely allied to Antocha (Antocha) flavella Edwards and A. (A.) nobulosa Edwards, both from the Malay Peninsula, differing in the gray coloration of the head, color of the antennæ, uniformly yellow thorax and abdomen, darkened femoral tips, and details of pattern of the wings. In the last-mentioned regard, the fly is more like nebulosa, which in all other respects is very distinct.

ANTOCHA (ANTOCHA) KHASIENSES *p. nov. Plate 1, kg. 8; Plate 2, kg. 25.

General coloration pale yellow, the transverse suture of mesonotum narrowly darkened; antennse yellow; legs yellow, the tips of femora rather narrowly but conspicuously blackened; wings milky white, patterned with brownish black, including the prearcular field and subcostal cell as far distad as the level of origin of Re; cord and outer end of cell 1st M₂ narrowly scamed with dark; m-cu more than its own length before the fork of M; male hypopygium with the outer dististyle obtuse at apex; inner gonopophysis acutely pointed, with a pale lateral flance.

Male.-Length, about 3.5 to 3.7 millimeters; wing, 4 to 4.4.

Female.-Length, about 3.5 millimeters: wing, 4.

Rostrum yellow; palpi scarcely darkened. Antenno short, yellow, the outer flagellar segments a trifle darker; flagellar segments oval. Head yellow.

Mesonotum pale yellow, the suture narrowly dark brown, the pattern a little more expanded at lateral ends. Pleura pale yellow. Halteres pale yellow throughout. Legs yellow, the tips of the femora narrowly but conspicuously blackened, the amount subequal on all legs; in the allotype the femora are somewhat less extensively darkened; tibia more narrowly darkened at tips; tarsi yellow, the outer segments darker. Wings (Plate 1, fig. 8) milky white, patterned with brownish black, in the costal field the latter color alternating with brighter yellow areas, most evident on the costal vein before and beyond the dark stigma; prearcular field and cell Sc as far distad as the origin of Rs blackened; cord and outer end of cell 1st M2 seamed with blackish; veins pale, darker in the clouded areas, including the outer medial voins. Venation: R2.3 only a little longer than R2, the latter lying far before the level of r-m; m-cu more than its own length before the fork of M.

Abdomen, including hypopygium, yellow. Male hypopygium (Plate 2, fig. 27) with the outer dististyle, od, short, and unusual-

ly obtuse at apex. Inner gonapophysis, g, terminating in an acute spinous point, the outer margin back from the point expanded into a pale flange that is wider towards the base.

Habitat.—Assam (Khasi Hills).

Holotype, male, Cherrapunji, altitude 4,000 feet, August, 1935 (Sircar). Allotopotype, female. Paratopotypes, 2 males.

Antocha (Antocha) khasiensis is most nearly related to A. (A.) nigribasis Alexander (western China), differing most conspicuously in the small size and structure of the male hypopygium. It is readily told from all other previously described species of the Himalayan and Indo-Malayan regions by the extreme basal position of m-cu and the coloration of the body, legs, and wings.

I am greatly indebted to Mr. S. Sircar for the following data on the conditions under which the present series of Tipulidæ were collected. "The specimens were collected by me personally at light (400 C. P. Petromax). It was showering very mildly and from my experience I can say that this is the best time for collecting Tipulidæ at light. Hundreds of these flies came to the light, but I could not save all of them as my net got wet and I had to catch them by hand as they rested on a cloth hung up by the side of the light."—S. Sircar.

HEXATOMINI

PSEUDOLIMNOPHILA CONCUSSA sp. nov. Plote 1, fig. 9; Plate 2, fig. 28.

General coloration brownish gray; antennæ black; wings relatively narrow, almost uniformly tinged with brownish yellow; costal fringe short; Rs long, subequal to vein R_3 ; R_2 at or close to fork of $R_{3\cdot4}$; cell M_4 present; cell 1st M_2 long and narrow, subequal to vein M_4 beyond it; m-cu at or close to fork of M_4 .

Male.-Length, about 7 millimeters; wing, 6.8.

Female.—Length, about 8 millimeters; wing; 7.5.

Rostrum dark; palpi black. Antennæ brownish black to black throughout, or (male) with the basal half of first flagellar segment paler; flagellar segments subcylindrical to cylindrical, with long conspicuous verticils. Head brownish gray; anterior vertex and orbits clearer gray.

Pronotum dark brownish gray. Mesonotum brownish gray, the præscutum with a slightly darker median stripe, somewhat more intense on cephalic portion; pseudosutural foveæ black. Pleura gray, variegated by more blackish gray on ventral anepisternum, sternopleurite, and meron. Halteres pale, the knobs infuscated. Legs with the fore coxe blackened, beavily pruinose; middle and hind coxe much paler; trochanters testaceous-

yellow; remainder of legs brownish yellow or, in cases, the femora more yellowish brown. Wings (Plate 1, fig. 9) relatively narrow, as compared to inconcusso, almost uniformly tinged with brownish yellow; stigma very faintly darker; voins darker brown. Costal fringe short in both sexes; Venation: Sc₁ ending opposite or just before fork of Rs, Sc₂ at its tip; Rs long, nearly straight to very gently arcuated at origin; $R_{2,3,4}$ elongate, only a little shorter than vein R_3 ; R_2 at or very close to fork of $R_{2,4}$; $R_{1,2}$ from one and one-half to twice the length of R_2 ; cell M_1 present, about as long as its petiole; cell 1st M_2 relatively long and narrow, its inner end arcuated, the lower face of the cell subequal to or even longer than vein M_4 ; m-cu at or just beyond fork of M_1 ; anterior arculus present.

Abdomen dark brown, sparsely pruinose, the hypopygium a trifle brighter. Male hypopygium (Plate 2, fig. 28) with the outer dististyle, od, a little longer than the inner style, id, straight, its apex decurved into a slender spine; inner margin before apex with a few denticles. Interbasal rods slender, each with a low obtuse flange at near midlength.

Habitat.—China (Hajnan Island).

Holotype, male, Ta Hian, altitude 2,000 feet, June 14, 1935 (Gressitt). Allotype, female, Dwa Bi, altitude about 1,500 feet, July 21, 1935 (Gressitt).

Pseudolimnophila concussa is very closely allied to P. inconcussa (Alexander), of Japan and China, and may prove to be only a more southern race of the latter. The unusually narrow wings, with narrow cell 1st M₂ serve to separate the fly from the usually larger and more vigorous inconcussa.

PSEUBOLIMNOPHILA SETICOSTATA sp. nev. Flate 1, 5g. 10.

General coloration of mesonotum uniformly dark brown, the pleura a little paler; antennæ black throughout; flagellar verticils very long; legs brownish black; wings a faint brown tinge; costal fringe (male) unusually long and dense; R₂ at or before fork of R_{3.4}; cell M₁ lacking; m-cu a short distance beyond fork of M; abdominal tergites dark brown, the sternites more brownish yellow.

Male.-Length, about 5 millimeters; wing, 5.5.

Rostrum obscure yellow to yellowish brown; palpi black. Antennæ black throughout; flagellar segments subcylindrical, with long verticils that greatly exceed the segments. Head brownish black above, the anterior vertex and orbits a very little paler; anterior vertex relatively wide, exceeding twice the diameter of scape.

Pronotum and mesonotum almost uniformly dark brown, the pleura a little paler. Halteres dusky, the base of stem very narrowly paler. Legs with the coxa brown; trochanters yellowish brown; remainder of legs brownish black. Wings (Plate 1, fig. 10) with a faint brownish tinge; stigma oval, slightly darker brown; veins medium brown, much darker than the ground. Costal fringe (male) unusually long and dense, the sette longer than the width of cell Sc1. Venation: Sc1 ending shortly before level of fork of Rs, Sc, near its tip; R, variable in position, in the paratype being some distance before the fork of R_{a+b} veins R_{t+b} . R_{2i} and R_{3i4} in this case being subequal in length; in the holotype \mathbf{R}_2 is at or very close to the fork of \mathbf{R}_{2-4} , eliminating or greatly reducing the latter element; veins Ra and R. diverging rather conspicuously, cell R₃ at margin being considerably more extensive than cell R₂; cell M₁ lacking; m-cu a short distance beyond fork of M; anterior arculus present.

Abdominal tergites dark brown, the sternites and hypopygium more brownish yellow.

Habitat.-China (Hainan Island).

Holotype, male, Ta Han, altitude 2,500 feet, June 21, 1935 (*Grossitt*). Paratype, male, Dwa Bi, altitude about 1,500 feet, July 22, 1935 (*Grossitt*).

The long dense costal fringe of the male (though possibly not of the still unknown female) is much like that of the otherwise very distinct P. costofimbriata Alexander, of southern India, the latter species having cell M₁ present and very deep. Pseudo-limnophila descripta Alexander, of the mountains of Formosa, has cell M₁ lacking, but differs from the present fly in other venational details. The female sex of the latter species has the costal fringe short, but the male is still unknown.

Genus HEXATOMA Latreille

Herntonia Latarille, Gen. Crust. et Ins. 4 (1809) 260.

Subgenus EUREXATOMA novum

Characters as in the subgenus Eriocera Macquart, having four branches of radius and four of media reaching the wing margin; cell 1st M_2 closed. Supernumerary crossveins in each of cells R_2 , R_4 , and R_5 in approximate alignment (Plate 1, fig. 11).

Type of subgenus.—Hexatoma (Euhexatoma) triphragma sp. nov. (Oriental Region: Eastern China, Hainan Island).

The new subgenus is based on the presence of three strong supernumerary crossveins in the outer radial field of the wing, a character paralleled by other subgeneric groups in the allied 61, 1

129

hexatomine genera Adelphomyia Bergroth and Linnophila Macquart. The present fly is of very strange appearance, the outer radial field giving one a definite impression of resemblance to the wing of a scorpion fly (Mecoptera).

HEXATOMA (EIIHEXATOMA) TRIPHRAGMA op. nov. Plate 1, 2g. 11.

General coloration of thorax brownish yellow, the præseutum with three confluent darker brown stripes; antennal flagellum yellow; femora yellow, the tips narrowly blackened; wings dark brown, the veins narrowly but conspicuously bordered by yellow; wing tip more broadly yellowish; small paired byaline droplets near outer ends of cells R_4 and R_5 , respectively; supernumerary crossveins in cells R_5 , R_6 , and R_5 ; cell M_1 present; m-cu at near two-thirds the length of cell 1st M_2 ; abdominal tergites reddish brown, the hypopygium brownish yellow.

Male.—Length, about 20 millimeters; wing, 16.

Rostrum dark brown; palpi short, brown. Antennæ 7-segmented; scape and pedicel yellowish brown; flagellum yellow, the outer segments a little darkened; flagellar segments cylindrical, gradually decreasing in length outwardly. Head brown; vertical tubercle entire, its margin rounded.

Pronotum brown. Mesonotal præscutum brownish yellow, with three darker brown stripes that are confluent behind; posterior sclerites of notum chiefly brownish black. Pleura obscure yellow, variegated by dark brown on the ventral anepisternum, ventral sternopleurite, meron, and pleurotergite. Halteres brownish yellow. Legs with the coxe light brown, trochanters more reddish brown; femora yellow, the tips narrowly blackened, the amount subequal on all legs and including about the distal sixth or seventh of the segment; tibiæ brown, the tips narrowly blackened; tarsi black. Wings (Plate 1, fig. 11) with the ground color dark brown, the veins narrowly but conspicuously bordered by yellow; wing tip more extensively of the same color; two small paired hyaline droplets near outer ends of cells R4 and R5, beyond the supernumerary crossveins of these cells; cell 1st A more grayish, cell 2d A yellow, margined outwardly with gray; vague linear pale streaks in central portions of cells R₁, M, and M₄; veins yellow to brownish yellow, contrasting with the dark ground. Scattered macrotrichia on all outer radial branches. Venation: Sc, ending about opposite R_2 ; $R_{z\cdot z\cdot 4}$ a little shorter than the basal section of R_z ; $R_{t\cdot 2}$ longer than $\mathbf{R}_{2\cdot3\cdot4}$; the supernumerary crossveins in the radial field slightly variable in position, those in cells $m R_3$ and $m R_4$ more oblique

than the one in cell R_3 ; in the left wing of type, the vein in cell R_3 lies more than its own length beyond the one in cell R_3 , whereas in the right wing the elements are nearly interstitial, as illustrated; cell M_1 present; m-cu much longer than the distal section of Cu_3 , placed at near two-thirds the length of cell 1st M_2 .

Abdominal tergites deep reddish brown, without differentiated basal coloring on the individual segments; basal and subterminal segments somewhat darker; sternites clearer reddish brown; hypopygium brownish yellow.

Habitat,-China (Hainan Island).

Holotype, male, Liamui, altitude about 1,200 feet, July 31, 1985 (Gressitt).

This rather remarkable crane fly requires no comparison with any previously described member of the genus, the subgeneric character of three supernumerary crossveins in the outer radial field being quite unique within the group.

BEXATOMA (ERIOCERA) TUBERCULATA ap. nov. Plate 1. Dg. 12.

Belongs to the perennis group; general coloration of thorax dull gray, the prescutum with four scarcely differentiated plumbeous-gray stripes that are narrowly bordered by blackish; setæ of thoracic dorsum short and inconspicuous; a median series of from three to five small tubercles at cephalic portion of præscutum; halteres and legs black; wings dark brown, with an oval yellow discal area before cord; costal vein in both sexes with abundant short setæ; cell M, present; abdominal tergites purplish blue, with about the outer third of the segments duil black; hypopygium and shield of ovipositor orange.

Male.—Length, about 19 to 24 millimeters, wing, 15 to 19. Female.—Length, about 24 to 25 millimeters; wing, 16 to 17.

Rostrum dark gray; palpi black. Antennæ short in hoth sexes, in male 7-segmented, in female 11-segmented; scape and pedicel black, sparsely pruinose; flagellum obscure yellow to yellowish brown. Head dull black, a little more grayish on front and on posterior orbits; vertical tubercle entire, unusually slender, especially in male. Vestiture of head of moderate length.

Pronotum dull dark gray, the lateral angles of the scutum produced into tuberculate lobes; scuteflum with a deep median incision on anterior border. Mesonotal prescutum dull gray, with four scarcely differentiated plumbeous-gray stripes that are narrowly bordered by blackish; anteromedian portion of prescutum elevated into from three to five small tubercles arranged in a longitudinal row; posterior sclerites of notum duli plumbeous-gray. Vestiture of thoracic dorsum unusually short and sparse.

Pleura entirely blackened, very sparsely pruinose. Halteres short, black throughout. Legs entirely black. Wings (Plate 1, fig. 12) dark brown, the anal cells a little paler; an oval yellow discal area before the cord, occupying the outer end of cell R and adjoining parts of cells R_1 and M_2 , with a slight invasion of the extreme base of cell 1st M_2 ; veins dark reddish brown, brighter in the yellow area; some of the veins adjoining the discal brightening very narrowly and insensibly bordered by yellow. Costa with abundant small sette in both sexes; outer branches of R with trichia, more sparse and scattered on R_3 ; a few scattered trichia on vein M_1 and, in cases, on M_2 . Venation: Sc, ending shortly beyond R_2 ; Rs angulated to spurred very close to origin; $R_{1,2}$ much longer than $R_{2,3,4}$, the latter subequal to basal section of R_3 ; cell M_1 present; m-cu at near two-thirds to three-fourths the length of cell 1st M_2 .

Abdominal tergites two to seven, inclusive, brilliant purplish blue, the caudal margins of the segments dull black, involving about the outer third of the sclerite; sternites more uniformly blackened, the basal rings less brilliantly blue; male hypopygium and shield of ovipositor orange.

Habitat.-China (Hainan Island).

61, 1

Holotype, male, Fan Ta, altitude about 1,250 fcct, June 3, 1935 (Gressitt). Allotype, female, Ta Hian, altitude 2,000 feet, June 11, 1935 (Gressitt). Paratypes, 2 males, with the allotype, June 12 and 13, 1935; 1 male, 1 female, Liamui, altitude about 1,200 feet, August 1 and 2, 1935 (Gressitt).

By Edwards's key to the Old World species of Eriocera, the present fly runs to couplet 87, disagreeing with species beyond this point by the lack of yellow or orange areas on the intermediate abdominal segments, as well as in several other features. The fly is quite distinct from all other species known to me.

HENATOMA (ERIOCERA) HIGTITHORAN My. nov. Plate 1, fig. 13.

General coloration deep velvely black; head and thorax with long, coarse, creet sette; halteres and legs black; wings strongly blackened, with a narrow white discal area before the cord; numerous macrotrichia on veins beyond cord; cell M₁ lacking; m-cu beyond outer end of cell 1st M₂ on vein M₄; abdomen velvety black, segments two, four, and five with leaden-colored basal bands; genital shield black; valves of ovipositor orange.

Female.-Length, about 16 millimeters; wing, 12.5.

Ann. & Mag. Nat. Hist. IX 8 (1921) 70-78.

Rostrum black, sparsely pruinose; palpi black. Antennæ (female) 11-segmented; scape and pedicel black; flagellum brownish black, the incisures of the more proximal segments narrowly paler; flagellar segments with long coarse verticils; segments gradually decreasing in length outwardly, the terminal a little longer than the penultimate. Head dark gray, with very long, coarse, black setæ.

Thorax uniformly velvety black, with long coarse setze, especially conspicuous on the dorsum. Halteres and legs black throughout. Wings (Plate 1, fig. 13) strongly blackened, the anal cells much paler, grayish; a narrow white discal area before cord, including cells R1 to Cu, inclusive, the last area narrowly separated from the remainder of the band by a narrow dark seam adjoining vein Cu in cell M; the gray anal cells variegated by more infuscated area at near midlength and by more brightened areas near outer end of cell 1st A and basal portion of cell 2d A; veins dark, paler in the discal brightening. Costal fringe short but abundant, longer and more conspicuous basad of h; macrotrichia of veins beyond cord abundant, including all veins from R1.2 to Cu1, inclusive, more sparse and restricted in the medial and cubital fields. Venation: Sc, ending nearly opposite R_2 ; $R_{1,2}$ much longer than either $R_{2,3,4}$ or $R_{2,3}$; medial veins very faint and difficult to trace; cell M1 lacking; m-cu erect, placed beyond the outer end of cell 1st M_2 on vein M_4 .

Abdomen velvety black, segments two, four, and five with leaden-colored or plumbeous basal bands, segments three, six, and seven uniformly blackened; sternites black; genital shield black; valves of ovipositor orange.

Habitat.-China (Hainan Island).

Holotype, female, Liamui, altitude about 1,200 feet, July 31, 1935 (Gressitt).

Hexatoma (Eriocera) hirtithorax is one of rather numerous species discovered in recent years that runs to H. (E.) hilpa (Walker) by means of existing keys to the subgenus. It is distinguished from allies in this particular group of forms by the coloration of the wings and abdomen, the venation, as the deep fork of cell R_3 and direction and position of m-cu, and by the unusually long erect pubescence of the head and thorax. In the latter feature the species agrees well with H. (E.) villosa Edwards (Perak), which has an apical pale crescent on the wings, additional to the pale discal area.

ELEPHANTOMYIA (ELEPHANTOMYODES) ANGUSTICELLALIA 22. 1004. Plate 1, Sz. 11.

General coloration of mesonotum brownish yellow, the pleura a trifle more infuscated; rostrum approximately one-half as long as remainder of body; basitarsus with proximal two-thirds black, the distal third snowy white; wings subhyaline; cell Sc, stigma and outer end of cell R_2 uniformly and continuously infuscated; basal section of R_3 almost in longitudinal alignment with R_3 ; cell 2d A very short and narrow; abdominal tergites inconspicuously bicolorous, obscure yellow, the caudal portions of the segments blackened, the outer three segments uniformly blackened.

Male.—Length, excluding restrum, about 10 millimeters; wing, 6.5; rostrum alone, 5.

Rostrum black throughout, approximately one-half as long as remainder of body. Antennæ black; flagellar verticils long and conspicuous. Head brown, the orbits narrowly light gray; anterior vertex relatively wide, a little greater than the diameter of scape.

Mesonotum uniformly dull brownish yellow, the pleura a frifle more infuscated. Halteres obscure, the knobs a trifle more dusky. Legs with the coxæ weakly infuscated; trochanters brownish yellow; femora brownish black, a little brightened basally, deepening to black at tips; tibiæ black; basitarsi black, the distal third snowy white; remainder of tarsi snowy white, the terminal segment infomed. Wings (Plate 1, fig. 14) subhyaline, cell Sc, stigma and adjoining narrowed outer portion of cell R2 uniformly and continuously infuscated; veins black. Venation: Rs strongly arcuated; anterior branch of Rs at origin arguated in almost the same degree as Rs, its distal portion gently sinuous and running close to R1; basal section of vein R, almost in longitudinal alignment with the end of Rs, a little shorter than r-m; cell 1st My longer than vein M4 beyond it; m-cu about one-half its length beyond the fork of M; cell Cu gradually widened to margin; vein 2d A short, the cell unusually short and narrow.

Abdominal tergites obscure yellow, blackened medially and caudally, the outer three segments uniformly blackened; sternites more uniformly obscure yellow, the caudal portions of the segments more infuscated.

Habitat.-China (Hainan Island).

Holotype, male, Ta Han, altitude 2,000 feet, June 7, 1935 (Gressitt).

Elephantomyia (Elephantomyodes) angusticellula is generally similar to several other species of the subgenus in the Oriental and eastern Palearctic faunal regions, such as E. (E.) aurantia (Brunetti), E. (E.) fuscomarginata Enderlein, and E. (E.) uniformis Alexander, differing from all in the body coloration and the details of venation, especially the very short and narrow cell 2d A. In the last-mentioned regard, the nearest approach to the present fly is found in uniformis.

ERIOPTERING

TRENTEPORUJA (MONGOMA) HAINANICA ap. nov. Plate 1, fig. 15.

Thorax entirely orange-yellow, immaculate; antennæ black throughout; femora obscure yellow basally, passing into brown; tibiæ dark brown; tarsi paling to yellowish brown; wings whitish subhyaline, the prearcular and costal regions clear light yellow; a restricted dark pattern, including the wing tip and a seam along vein Cu₁; R₂ at or beyond the fork of R_{2.3.4}; abdomen black, the bases of the intermediate segments vaguely brightened.

Male.—Length, about 9 millimeters; wing, 7.2. Female.—Length, about 11 millimeters; wing, 8.5.

Rostrum brown; palpi black. Antennæ black throughout; flagellar segments cylindrical, the verticils shorter than the segments. Head brownish yellow; anterior vertex reduced to a narrow strip, carinate, the ridge extending caudad onto the posterior vertex.

Pronotum yellow. Mesonotum and pleura entirely deep orangeyellow, immaculate. Halteres with basal third of stem obscure yellow, the outer portion and knob blackened. Legs with the coxe and trochanters yellow; femora obscure yellow basally, passing into brown, the tips gradually deepening to dark brown; tibiæ dark brown; tarsi paling to yellowish brown; bases of femora with a series of from eight to ten small black spines; posterior tibiæ near apex with about four powerful black setæ, the outermost shorter. Wings (Plate 1, fig. 15) whitish subhyaline, the prearcular and costal regions clear light yellow; stigma dark brown; paler brown washes include the extensive wing tip, vague seams along cord, a broad, conspicuous seam in cell M adjoining vein Cu, and the axillary region; veins brownish black, luteous in the yellow basal and costal portions. Venation: R2 at or beyond fork of R2.3-4; m-cu at or before (male) fork of M; apical fusion of veins Cu1 and 1st A slight; cell 2d A wide.

135

Abdomen black, the bases of the intermediate tergites very vaguely brightened by brownish yellow; genitalia of both sexes obscure yellow.

Habitat.-China (Hainan Island).

B1, t

Holotype, male, Ta Han, altitude 2,500 feet, June 22, 1935 (Gressitt). Allotopotype, female, June 23, 1935 (Gressitt).

Trentepohlia (Mongoma) hainanica is allied to T. (M), auricosta Alexander and T. (M), flavicollis Edwards, of Java, especially to the former. The differently natterned thorax, legs, and wings, and the uniformly darkened halteres, readily separate the present fly from these somewhat similar species. By my latest key to the Philippine species of Trentepohlia, the fly runs to T. (M) carbonipes Alexander, of Mindanao, a very different fly.

GONOMYIA (PTILOSTENA) HAINANENSIS ap. nov. Pinto 1, pg. 16.

General coloration of mesonotum dark brown, more reddish brown on sides; knobs of halteres darkened; femora yellow, with a narrow but conspicuous brownish black ring just before apex; wings yellow, sparsely patterned with dark brown; stigma oval, extending distant to vein R_3 ; vein R_4 gently archated; abdominal tergites black, the caudal margins narrowly yellow.

Female.-Length, about 5.5 millimeters; wing, 5.

Rostrum and palpi dark. Antennæ with scape brownish yellow; pedicel yellow; flagellum broken. Head brownish gray.

Pronotum obscure yellow above, darker on sides. Lateral pretergites light yellow. Mesonotal præscutum dark brown medially, more reddish brown on sides, the humeral region with a very restricted area of light yellow; pseudosutural foveæ brownish black; scutum dark brown; scutellum testaceous-brown; mediotergite dark, with a proinose gray triangle on cephalic portion, the point directed backward. Pleura reddish brown, the dorsal sclerites somewhat darker. Halteres pale, the knobs darkened. Legs with the coxæ testaceous-brown; trochanters testaceous-yellow; femora yellow, with a narrow but conspicuous brownish black ring just before apex; tibiæ obscure yellow, the tips narrowly blackened; tarsi brownish yellow, darker outwardly. Wings (Plate 1, fig. 16) with the ground color yellow, sparsely patterned with dark brown, the areas including a small arcular darkening, origin of Rs, cord and m-cu, stigma, and a

Philip, Journ. Sci. 53 (1934) 442-444.

paler brown submarginal wash in outer ends of cells R_3 and R_4 ; no darkening at outer end of vein 2d A; wing tip deeper yellow than the remainder of ground; stigmal area oval, extending distad to vein R_3 or virtually so; veins yellow, darker in the infuscated areas. Costal fringe relatively long and conspicuous; numerous macrotrichia on all veins beyond level of m-cu and on veins M and 1st A nearer the wing base. Venation: Sc_1 ending about opposite one-fourth the length of the strongly angulated to weakly spurred R_3 ; $R_{1,2}$ and R_3 close together at wing margin; vein R_4 gently arcuated, not strongly recurved as in teranishii and allies; medial fork about one-third longer than its petiole; m-cu less than twice its length before fork of M_4 .

Abdominal tergites black, the caudal margins of the segments narrowly but conspicuously yellow; sternites more brownish yellow, the yellow apices not so clearly defined.

Habitat.—China (Hainan Island).

Holotype, female, Ta Han, altitude 2,500 feet, June 21, 1935 (Gressitt).

The nearest described allies are Gonomyia (Ptilostena) longipennis Alexander (Loochoo Islands) and G. (P.) teranishii Alexander (Japan, castern and southern China), which differ in the coloration of the body, the uniformly pale femora, and the details of wing pattern and venation, notably the more strongly arenated vein R_4 .

GONOMYIA (LIPOPHLEFS) CONQUESITA op. pov. Plate 1. fig. 11.

Belongs to the sulphurella group; allied to nubeculosa; general coloration of notum dark gray; scutellum obscure yellow, darkened medially at base; femora yellow, with a narrow, dark brown, subterminal ring, the yellow apex subequal in extent or slightly wider; wings tinged with grayish, the costal border and apex whitened; abdominal tergites black, the caudal borders of the segments narrowly yellow.

Female.-Length, about 5 millimeters; wing, 4.

Rostrum and palpi black. Antennæ with scape and pedicel yellow above, darker on lower surface; flagellum broken. Head above obscure yellow, the central portion of posterior vertex more infuscated, its sides and the genæ again darkened.

Pronotum yellow, darker on sides; pretergites light yellow. Mesonotal præscutum and scutum dark gray; pseudosutural fovæe dark red, inconspicuous against the ground; scutellum obscure yellow, the basal portion darkened medially; postnotum gray. Pleura brownish black, with a conspicuous, whitish, longitudinal stripe extending from the fore coxe to the base of

abdomen; ventral stornopleurite and meron darkened; pteropleurite and pleurotergite somewhat paler brown than the anterior selecites. Halteres yellow, the knobs weakly darkened basally. Legs with the fore coxe whitened, middle and posterior coxæ darker basally, the tips pale; femora yellow, with a narrow, dark brown, subterminal ring, this subequal to or narrower than the yellow apex; tibiæ yellow; tarsi broken. Wings (Plate 1, fig. 17) with a grayish tinge, the costal border and apex whitened, the latter including the distal ends of cells R4, R4, and 2d M_2 as far basad as the level of the tip of vein R_4 ; stigma small, oval, brown, interrupting the white costal border; restricted darker areas at arculus, origin of Rs, along cord and outer end of cell 1st M_2 , and as a seam on vein R_2 ; veins pale, darker in the infuscated areas, more whitened in the pale portions of the wing. Costal fringe pale, relatively long and conspicuous: rather numerous macrotrichia on veins $R_{2,3,4}$, R_4 , distal section of R_0 , and distal sections of M_{1+2} and M_3 ; a few trichia at extreme outer end of vein 2d A. Venation: Sc, ending opposite origin of the long Rs, Sc, close to its tip; Rs subequal in length to stem of cell R₃; vein R₃ very short, perpendicular; cell R2 at margin considerably more extensive than cell R3; vein R_{\star} rather strongly upcurved at margin; m-cu shortly before fork of M.

Abdominal tergites black, the caudal borders of the segments narrowly yellow; sternites somewhat more grayish black, the pale borders narrower. Cerci horn-colored, darkened basally.

Habitat .- China (Hainan Island).

Holotype, female, Ta Han, altitude 2,500 feet, June 21, 1985 (Gressitt).

Gonomyia (Lipophleps) conquisita is readily told from other members of the group that are closely allied to nubcculosa (de Meijere), including pullidisignata Alexander, by the narrow brown femoral rings. In all species of the group hitherto described, these annuli are black, very broad, and preceded and followed by narrow whitened rings.

CONOMYIA (LIPOPHLEPS) PALLICOSTATA ap. nov. Plate 1, fig. 18; Plate 2, fig. 29.

Allied to bicolorata; femora brown, the extreme tip abruptly pale; wings suffused with brown, the costal and apical portions narrowly white, the remainder of membrane more or less variegated by paler areas; stigma oval, dark brown; Sc short, Sc, ending before origin of Rs a distance nearly equal to the length of the latter vein; male hypopygium with two dististyles, the outer one bilobed, its outer arm a long, slender, simple rod, the

inner arm a densely hairy cushion; inner style terminating in a carved spine and bearing a second, very long spine on outer margin at near midlength.

Male.—Length, about 3.2 to 3.4 millimeters; wing, 3.5 to 3.8. Female.—Length, about 4 millimeters; wing, 4.

Rostrum and palpi black. Antennæ with the scape and pedicel yellow, flagellum black; flagellar segments (male) with unusually elongate verticils. Head chiefly yellow; badly flexed in types, but apparently with central darkening on posterior vertex.

Pronotum and lateral pretergites pale yellow, the former darkened on sides. Mesonotal præscutum and scutum almost uniformly dark brown, the pseudosutural foveæ black; scutelium black basally, obscure brownish yellow behind; mediotergite blackened, the anterolateral portions obscure yellow. Pleura chiefly dark brown, somewhat paler dorsally on the pteropleurite and pleurotergite, and ventrally on the ventral sternopleurite; a broad white longitudinal stripe extends from the fore coxe across the dorsal sternopleurite, ventral pteropleurite, and meral area to base of abdomen. Halteres yellow, the lower face of knob dusky. Legs with the coxe pale, their basal portions dark brown, the fore coxæ more uniformly whitened; trochanters testaceous-yellow; femora brown, somewhat darker outwardly, the extreme tip abruptly pale; tibix and tarsi brown. Wings (Plate 1, fig. 18) almost uniformly suffused with brown, the costal border and apex conspicuously china white, the degree nearly uniform throughout the area except before the stigma where the pale crosses Rs into cell R; stigma oval, dark brown; dusky ground color slightly variegated by paler areas, as in many allied forms; veins brownish yellow, paler, almost white, in the anterior pale portion. Costal fringe sparse, but long and conspicuous. Venation: Sc short, Sc, ending far before origin of Rs, the distance on costa nearly as long as Rs alone; branches of Rs divergent; cell Rs narrowed at margin; m-cu a short distance before fork of M.

Abdominal tergites dark brown, the posterolateral angles yellow, more broadly and conspicuously so on outer segments; subterminal segment more uniformly darkened; hypopygium yellowish brown. Male hypopygium (Plate 2, fig. 29) with two terminal dististyles; outer style, od, bilobed, the outer arm a simple, slender, blackened rod, a little longer than the basistyle; inner lobe more than one-half as long as the outer, flesby, the distal half with abundant yellow setw. Inner dististyle, id,

small, terminating in a slender, curved, acute spine; on outer margin at near midlength produced into a second, very long, nearly straight spine that exceeds the style in length, its base dilated. Phallosome, p, with two divergent subapical lobes, the tips with microscopic sette.

Habitat.-China (Hainan Island).

Holotype, male, Ta Han, altitude 2,500 feet, June 23, 1935 (Gressitt). Allotype, female, Ta Hian, altitude 2,000 feet, June 19, 1935 (Gressitt). Paratype, male, Liamui, altitude about 1,200 feet, August 3, 1935 (Gressitt).

The nearest described ally is Gonomyia (Lipophleps) bicolorata Alexander (Luzon, Hainan), which is similar in general appearance, but the structure of the male hypopygium is very different.

CONOMYIA (LIPOPRILEPS) PULLVINIFERA sp. nov. Plate 3, fig. 19; Plate 3, fig. 30.

Mesonotum brownish black, sparsely pruinose; scutellum yellow, darkened medially at base; thoracic pleura with a longitudinal yellow stripe; femora infuscated, with a broad, blackish, subterminal ring, preceded and followed by narrow, clearer yellow annuli; tibiæ and tarsi black; wings grayish subhyaline, the costal border whitened, the disk with extensive brown clouds; Sc short; male hypopygium with the outer dististyle a long blackened rod, its distal fifth expanded and densely set with a cushion of spines.

Male.-Length, about 3.5 millimeters; wing, 3.6 to 3.7.

Rostrum obscure brownish yellow; paini black. Antennæ black, the scape more or less brightened. Head orange-yellow, variegated by brownish black on central portion of disk.

Mesonotum brownish black, sparsely pruinose; pseudosutural foveæ black; scutclium yellow, darkened medially at base; postnotum more heavily pruinose. Pleura brownish black, the dorsal pteropleurite and pleurotergite more infuscated; a relatively narrow but conspicuous, pate yellow, longitudinal stripe extending from the fore coxæ to the base of abdomen, passing beneath the root of halteres, this stripe narrowly bordered dorsally by a dark stripe. Halteres yellow, most of the knobs infuscated. Legs with the coxæ darkened basally, paler at tips; trochanters brownish testaceous; femora infuscated, the distal third more yellowish, inclosing a broad, more-blackened subterminal ring, the actual tip and postmedian pale annulus much narrower; posterior femora with long erect setæ; tibiæ and tarsi brownish black. Wings (Plate 1, fig. 19) with the ground color grayish subhyaline, variegated by more brownish clouds near wing base,

across outer ends of cells R to 1st A, inclusive, and beyond the cord; costal border and conspicuous areas before and beyond stigma white; stigma oval, pale brown; voins pale brown, still paler in the brightened costal portions, darker along cord. Costal fringe relatively long and conspicuous; trichia of veins beyond cord relatively abundant. Venation: Sc short, Sc, ending some distance before origin of Rs, the distance on C being about two-thirds the length of Rs alone; r-m long, gently areuated.

Abdomen blackened, the caudal borders of both tergites and sternites restrictedly paler; hypopygium large, more chestnut-brown, the conspicuous outer dististyle black. Male hypopygium (Plate 2, fig. 30) with the two dististyles terminal in position. Outer dististyle, od, a long, nearly straight, blackened rod that is considerably longer than the basistyle, on apical fifth a little dilated and bearing a dense brush or cushion of spines; outer surface of stem of style with abundant spinous points or teeth. Inner dististyle, id, small, simple, long, and slender. Phallosome, p, not clearly evident in material studied, consisting of flattened pale cushious and a single, acute, smooth black spine.

Habitat.-Assam (Khasi Hills).

Holotype, male, Cherrapunji, altitude 4,000 feet, August, 1935, at light (Sircar). Paratopotype, 2 males.

By Edwards's key to the Oriental species of *Lipophleps*,⁶ the present fly runs to *subnebulosa* Edwards, a quite different species with the wing pattern distinct. As usual in the genus, the male hypopygium offers the chief feature for the separation of the species from allied forms.

CONOMYTA (LIPOPHLEPS) SIRCARI sp. nov. Plate 1, 6g. 20; Plate 2, ng. 51,

General coloration dark brownish gray; scutellum obscure yellow on posterior border; pleura with a light yellow longitudinal stripe; legs dark brown; posterior femora with a series of more than a score of creet setæ; wings with a faint brown tinge, the disk slightly variegated by more grayish subhyaline areas; Sc short; male hypopygium with the outer dististyle a simple rod; inner dististyle bearing two long, slender, pale arms, each tipped with a small blackened spine; phallosome with appressed spinulose points.

Male.-Length, about 3 millimeters; wing, 3.3.

Rostrum and palpi black. Antennæ black throughout. Head above orange-yellow, the central portion of vertex more darkened.

^{&#}x27;Journ. Fed. Malay St. Mus. 14 (1928) 104-105.

Pronotum and anterior lateral pretergites yellow. Mesonotal præscutum and scutum uniformly dark brownish gray, without markings; scutellum obscure yellow on the posterior border. broadly darkened medially at base; postnotum obscure yellow on cephalic half, the posterior portion darkened. Pleura with the dorsopleural membrane and most of pteropleurite and pleurotergite obscure yellow, the more ventral pleurites brownish gray, with a conspicuous light yellow longitudinal stripe extending from and including the fore coxe, reaching the base of abdomen. Halteres dusky, with most of the knob light yellow. Legs with the fore coxe yellow, the remaining coxe and all trochanters more testaceous; remainder of legs dark brown; posterior femora with an evenly spaced series of more than a score of long erect setw, additional to the usual appressed vesti-Wings (Plate 1, fig. 20) with a faint brownish tinge, the prearcular and costal portions more clearly yellow; stigma small, oval, a little darker than the ground color; disk variegated by more grayish subhyaline areas on the posterior half of wing. the radial field more uniformly pale brown; veins pale brown, a little lighter in the costal and prearcular fields. Costal fringe moderately long, at base with setse very sparse and tiny; anterior branch of Rs without trichia; R5 and all outer branches of M with numerous trichia. Venation: Sc short, Sc, ending some distance before origin of Rs, the distance on C equal to about two-thirds the length of Rs; Rs only a little shorter than its anterior branch, the latter directed strongly cephalad, so cell R4 at margin is very wide; m-cu close to fork of M.

Abdominal tergites dark brown, the incisures restrictedly paler; sternites and hypopygium more yellowish. Male hypopygium (Plate 2, fig. 31) with two dististyles, both terminal in position. Outer style, od, a simple sinuous rod, the base with a small mesal flange, the central third of the blade a little wider, the apex obtuse. Inner style, id, bearing two, long, slender, pale arms, each tipped with a small blackened spine; outer rod a little longer than the inner, the latter bearing two spines on one side and only one on the other (of the unique type, probably abnormal, and the condition may be normally unispinous). Phallosome, p, appearing as two divergent, flattened, black horns that run out into smooth black spines, the surface microscopically serrulate and provided with appressed spinulose points.

Habitate -- Assam (Khasi Hills).

Holotype, male, Cherrapunji, altitude 4,000 feet, August, 1935, at light (Sircar).

I take great pleasure in naming this distinct crane fly in honor of the collector of this interesting series of Tipulidæ from the Khasi Hills, Mr. S. Sircar. The species is readily distinguished from other, generally similar, allied species in this faunal area, such as flavomarginata Brunetti and nissoriana sp. nov., by the structure of the male hypopygium.

GONOMYIA (LIPOPRILEPS) NISSORIANA sp. zor. Plate 1, úg. 21; Plate 2, dg. 22.

General coloration dark brown; scutchum obscure yellow, darkened medially at base; pleura with a clear yellow longitudinal stripe; knobs of the halteres darkened; legs brownish black; wings with a faint brown tinge, the costal border whitened; stigma and narrow seams along cord and outer end of cell 1st M₂ vaguely seamed with pale brown; Sc short; abdominal tergites uniformly dark brown, the sternites and hypopygium yellow; male hypopygium with both dististyles terminal in position, the inner at apex produced into a long yellow arm that is tipped with a small black spine and bears a single very long bristle that is longer than the arm itself.

Malc.--Length, about 2.7 millimeters; wing, 8.

Rostrum and palpi black. Antennæ with the scape black, pedicel chiefly orange, flagellum black. Head light yellow, the central portion of vertex weakly darkened.

Pronotum and the lateral pretergites light yellow. Mesonotal præscutum and scutum dark brown, the surface sparsely pruinose; pseudosutural foveæ reddish brown; scutellum obscure yellow, the base darkened; mediatergite extensively obscure yellow, darkened behind and on sides. Pleura with dorsal sclerites and membrane brownish yellow; a broad, clear yellow, longitudinal stripe extending from the fore coxe to the base of abdomen, passing beneath the halteres, narrowly bordered above by darker brown; ventral sternopleurite darkened. teres with the stem dusky, the knob yellow. Legs with the coxe testaccous, the fore pair somewhat clearer; remainder of legs brownish black; posterior femora with moderately erect setze along the entire length. Wings (Plate 1, fig. 21) with a faint brown tinge, the prearcular and costal portions more whitened; stigma long-oval, slightly darker brown than the ground; cord and outer end of cell 1st Mg vaguely seamed with pale brown, best indicated by a darkening of the veins; veins brown, more yellowish in the whitened areas. Anterior branch of Rs without trichia; R5 and all outer branches of M with numerous trichia. Venation: Sc short, Sc, ending some distance before origin of Rs, the distance on C about one-half Rs; anterior

branch of Rs directed rather strongly cephalad so cell R_2 at margin is only a little more than one-third as extensive as cell R_4 ; m-cu at fork of M.

Abdominal tergites uniformly dark brown; sternites and hypopygium yellow. Male hypopygium (Plate 2, fig. 32) with the two dististyles terminal in position, the outer style, od, a glabrous darkened blade, shaped more or less like a cleaver, the margins smooth. Inner dististyle, id, at apex extended into a long, slender, yellow arm that is tipped with a small black spine and a single very long seta that is longer than the arm itself; the arm at near midlength bears a dense group of short setw. Phallosome, p, consisting of coiled yellow rods that terminate in a dense brush of setw.

Habitat.—Assam (Khasi Hills).

Holotype, male, Cherrapunji, altitude 4,000 feet, August, 1935, at light (Sirear).

I take much pleasure in naming this distinct species in honor of Mr. Nissor Singh, veteran collector of the Himalayan Butter-fly Company, who celebrated his eightieth birthday in December. 1935. The fly is allied to species such as Gonomyia (Lipophleps) sircari sp. nov., and G. (L.) luteimarginata Alexander, differing very conspicuously from all described forms in the structure of the male hypopygium.

CRYPTOLADIS (R.EGURA) DICLADURA sp. nov. Flate 1, fig. 22; Plate 2, fig. 23.

General coloration dark gray, the scutellum yellow, darker medially at base; legs with short setæ; wings with a slight gray-ish tinge, the stigmal region weakly suffused; prearcular and costal regions more whitened; cell 2d A wide, vein 2d A deflected caudad on its distal third; male hypopygium with the dististyles subterminal in position, profoundly bifid, the inner arm longer than the outer.

Male.—Length, about 3.5 millimeters; wing, 3.8. Female.—Length, about 3.6 millimeters; wing, 4.

Rostrum dull black; palpi infuscated. Antennæ dark throughout; pedicel black; outer flagellar segments clongate. Head uniformly gray.

Pronotum yellowish white. Mesonotal præscutum and scutum almost uniformly dark gray, or blackish with a relatively sparse pruinosity; scutellum yellow, darker medially at base; postnotum gray. Pleura dark brownish gray, the dorsopleural region yellow. Halteres pale, the knobs darkened. Legs with the coxe and trochanters testaceous-brown; femora obscure yellow, the tips infuscated; tibiæ and tarsi brownish black; vestiture of legs

short and appressed, inconspicuous. Wings (Plate 1, fig. 22) with a slight grayish tinge, the stigmal region weakly suffused; a vague darkened seam along cord, best indicated by a more intense coloring of the veins traversed; prearcular and costal regions more whitened; veins brown, pale in the whitened areas. Costal fringe relatively long and conspicuous. Venation: R_2 a little shorter than $R_{2\cdot 3}$; n_1 -cu at near midlength of $M_{3\cdot 4}$; cell 2d A wide, the vein deflected caudad on its distal third.

Abdomen dark brown, the hypopygium brightened. Male hypopygium (Plate 2, fig. 33) with the ninth tergite, 9t, having each outer lateral angle produced into a slender straight point; median area of tergite slightly produced, the caudal border gently concave. Dististyle, d, subterminal in position, long and slender, profoundly bifid, the outer arm only about one-half as long as the inner but somewhat stouter. Ædeagus, a, terminating in a very long needlelike point.

Habitat.—China (Hainan Island),

Holotype, male, Ta Hian, altitude 2,000 feet, June 11, 1935 (Gressitt). Allotopotype, female. Paratopotype, I female.

Compared with other similar regional species of *Bxoura* that have the wings broad, cell 2d A wide, inconspicuously hairy legs, and conspicuously brightened scutchum, the present fly is readily told by the somewhat remarkable male hypopygium, especially the dististyle.

CRYPTOLABIS (BÆOURA) SETOSIPES ep. nov. Plate 1, fig. 23; Plate 2, fig. 34.

Belongs to the trickopoda group; general coloration black; scutchium obscure yellow; wings with a dusky tinge, the costal border more whitened; a broad dark seam along cord; cell 2d A narrow; male hypopygium with the lateral angles of the tergite extended caudad into narrow arms; dististyle deeply bilobed, the inner arm slender.

Male.—Length, about 3.3 millimeters; wing, 4. Female.—Length, about 3.5 millimeters; wing, 4.

Rostrum testaceous; palpi brown. Antenuæ apparently 14-segmented, short, dark brown; flagellar segments passing through short-cylindric into long-cylindric; terminal segment longer than the penultimate, constricted at near midlength; verticils very long and conspicuous. Head light gray; setæ and punctures conspicuous.

Pronotum testaceous-gray. Mesonotal præscutum dull black, the humeral region scarcely brightened; scutum, including median area, dull black; scutellum obscure yellow, darker medially at base, parascutella black; mediotergite dark, heavily gray

pruinose. Pleura black, heavily pruinose; dorsopleural membrane paler. Halteres dusky, the base of stem restrictedly brightened, the knobs a little paler. Legs with the fore coxe black, the middle and hind coxe a little paler; trochanters testaceous-yellow; femora brown; tibise and tarsi brownish black; segments with very long erect setæ, as in the group; claws (male) very long and slender, each with a long, pale, crect seta or setoid spine at base. Wings (Plate 1, fig. 23) with a dusky tinge, the entire costal border both before and beyond the stigma whitened; stigma and a broad confluent seam along the cord darker than the ground; basal portions of wing a trifle infumed; veins dark, paler in the whitened costal portions. Venation: Set ending opposite cord, Set not far from its tip; cell 2d A narrow.

Abdomen, including hypopygium, brownish black. Male hypopygium (Plate 2, fig. 34) with the tergite, 9t, produced laterad and caudad into slender glabrous points; median portion of caudal border likewise produced into a low triangular point. What seems to be a part of the eighth sternite is represented by a slender pale structure that terminates in two strong modified setze, suggesting the condition found in Styringomyia. Dististyle, d, terminal, deeply bifid, the broader outer arm with numerous setigerous punctures, including a dense group at apex; before tip, near inner margin of lobe, with two slender spines; inner arm nearly as long but much slenderer, with setze only at apex. Adeagus, a, broadly depressed, except on apical portion. Habitat.—China (Hainan Island).

Holotype, male, Ta Ilian, altitude 2,000 feet, June 11, 1935 (Gressitt). Allotype, female, Liamui, altitude about 1,200 feet, July 31, 1935 (Gressitt). Paratopotype, female.

In its hypopygial structure, Cryptolabis (Bwoura) setosipes is very different from the other members of the trickopoda group described to this date.

CRYPTOLAHIS (D/EOURA) CONSONA sp. nov. Pisio 2. 02. 35.

Belongs to the trichopoda group, closely affied to setosipes; male hypopygium with the outer lateral angles of tergite produced cauded into very long, slender blades, the tips subacute; dististyle simple, appearing as an elongate blade, narrowed outwardly to the obtuse tip, on outer face at near two-thirds the length with a small peglike spine.

Male.—Length, about 3.3 millimeters; wing, 4. Female.—Length, about 3.5 millimeters; wing, 4.

Rostrum and palpi dark. Antennæ of moderate length, dark throughout, apparently 15-segmented; basal flagellar segments

short-oval, the outer segments more clongate, with very long, conspicuous verticils. Head gray.

Mesonotum dull black, the surface very sparsely prvinose; scutellum obscure brownish yellow, the base darkened medially; postnotum more heavily pruinose. Halteres weakly suffused with dusky, especially the central portion of stem. Legs with the coxe brownish testaceous; trochanters obscure yellow; femora brown; tibiæ obscure yellow, the tip narrowly darkened, especially the distal portions of posterior legs; tarsi brown, passing into black outwardly; segments of legs with very long conspicuous setæ, as in the group. Wings with a strong dusky tinge, the costal region more whitish; a darkened cloud along cord; basal cells slightly infumed, leaving rather clearer areas before and beyond the cord; stigma a little darker; veins dark, somewhat paler in the costal field. Venation: Virtually identical with that of setosipes; cell 2d A a trifle narrower.

Abdomen, including hypopygium, brownish black. Male hypopygium (Plate 2, fig. 35) with the outer lateral angles of tergite, 9t, produced caudad into very long, slender blades, the tips subacute; caudal margin between the horns transverse or very slightly protuberant, not produced into a point as in setosipes. Dististyle, d, simple, appearing as an elongate blade that narrows outwardly, the tip obtuse; outer face of style at near two-thirds the length with a small peglike spine; before apex of style, near inner margin, with two or three small spinous points, as in setosipes.

Habitat.-China (Hainan Island),

Holotype, male, Dwa Bi, altitude about 1,500 feet, July 21, 1935 (Gressitt). Allotopotype, female.

Cryptolabis (Bxoura) consona is very similar in its general appearance to C. (B.) setosipes sp. nov., but is entirely distinct in the structure of the male hypopygium.

STYRINGOMYIA HOLOMELANIA sp. nov. Plate 1, fig. 24; Plate 2, fig. 36.

Entire body black; halteres and legs black, the tarsal segments slightly paler on basal portions; wings narrow, whitish subhyaline, the cord and vein Cu scamed with brown; anterior branch of Rs oblique; male hypopyglum with the basistyle bearing two spines, the inner one only half the length of the outer; outer lobe of dististyle with a dense group of spines near base; tenth tergite with median lobe very slender; ninth sternite bilobed at apex.

Male .- Length, about 5 millimeters; wing, 3.4.

Rostrum and palpi black. Antennæ black, the outer flagellar segments a triffe paler. Head black.

Thorax entirely black, including the coarse but unmodified setæ. Hafteres black. Legs black, the basal three tarsal segments a very little paler on their proximal portions. Wings (Plate 1, fig. 24) narrow, whitish subhyaline, the cord and vein Cu scamed with brown; veins brown. No macrotrichia on veins behind R₁ excepting a complete series of about twenty-two on vein R₅ and an isolated bristle on anterior branch of R₅; two or three trichia on outer ends of distal sections of medial veins. Venation: Anterior branch of R₅ oblique; cell 1st M₂ long and narrow, exceeding any of the veins beyond it; m-cu sinuous, at near one-third the length of cell 1st M₂; vein 2d A unspurred but strongly curved near outer end.

Abdomen black throughout. Male hypopygium (Plate 2, fig. 36) with the basistyle, b, bearing two unequal spines on a short apical lobe, the outer spine about twice the length of the inner, flattened on basal half; inner spine obtuse at apex. Tip of hasistyle with an acute blackened spine that is directed mesad. Outer lobe, od, of dististyle relatively stout, bearing a dense group or comb of equal black spines on mesal face near base; inner lobe, id, produced into two arms. Tenth tergite, t, with the median lobe very slender, appearing as a ligulate structure clothed with abundant erect setse. Ninth sternite, 9s, bilobed at apex, each lobe obtusely rounded, the median notch acute; the two usual modified setse placed basally on lobes, unusually slender and more or less decussate.

Habilat.-Assam (Khasi Hills).

Holotype, male, Cherrapunji, altitude 4,000 feet, August, 1935, at light (Sirear).

Styringomyia holomelania is very different from all described species that have bispinous basistyles on the male hypopygium. The uniformly black coloration of the body, halteres, femora, and tibiæ provide characters that separate the fly from all species of the genus hitherto described. It seems to be most nearly allied to S. obscura Brunetti, yet is amply distinct in the coloration of the body, wings, and legs.

REVIEWS

The Bacteriological Grading of Milk. By G. S. Wilson. Medical Research Council, Special Report Series, No. 206. His Majesty's Stationary Office, Landon, 1935. 392 pp. Price, \$2.

This book gives the results of the author's critical studies on the various technical procedures that have been heretofore used in the examination of milk. The usefulness of these procedures is discussed extensively with recommendations on the methods that should be followed.

A description of the modified methylene blue reduction test is given, and, according to the author, the test seems to fulfill most of the requirements demanded of the routine grading of raw milk. It gives more information about the milk than does the plate count, the performance of which requires an elaborate procedure by highly skilled workers. According to him the plate count seems to afford no better index of the sanitary conditions of production or of the keeping quality of the milk than the Breed test or the modified methylene blue test. The latter test could be advantageously applied even to certified milk.

Whether the test is suitable for the examination of freshly pasteurized milk or not is doubtful, but there is reason to believe that it could well replace the plate count on bottle samples delivered to the consumer.

Finally, it is recommended that whatever test is used no attempt should be made to divide milk into more than three or four classes. From the public-health point of view probably only two divisions need be made on the basis of cleanliness; namely, (a) milk that is suitable and (b) milk that is not suitable for human consumption in the liquid state.—T. R. R.

The World Economic Survey, 1934-35. Fourth Year. Economic Intelligence Service. League of Nations, Geneva, Switzerland, 1935. 310 pp. Price, \$2.

The book is an extensive review of the world economic and financial developments up to July, 1935, being the fourth of an annual series published by the League of Nations. The significant events featured in the international economic commotion during the last few years being presented in a comprehensive and coherent manner, this survey surely is indispensable to anyone who desires to gain a full grasp of the world economic situation. Considerable emphasis is laid on the subjects of currency, production, overseas trade, unemployment, and industrial recovery. Statistical tables, indices, and graphs are widely distributed from cover to cover, with the corresponding explanations so given as to be intelligible to the lay reader.

The opening chapter presents a kaleidoscopic view of the chaotic state of economic affairs the world over in 1934. Various steps undergone by the government towards the solution of the problems in finance and trade are mentioned as each country is surveyed. The movement of agricultural and industrial

prices is graphically dramatized by charts and tables. Statistical data of different countries illustrate impressively the law of supply and demand as it affects production, prices, and consumption. With the dawn of industrial recovery is treated the question of unemployment and stability of wages. The rôle played by the National Recovery Act, of all movements, is mentioned in this connection. The recent adjustments in international trade and equilibrium and the expanding basis of credit are equally dealt with comprehensively. The last chapter reviews the more recent constantly changing scenes in the world economic "movies," prominent among them being the "New Deal" program which has become linked with the Roosevelt administration.

The work is well indexed, and on the last pages is appended a chronological list of important world economic events from August, 1934, to July, 1935.—L. M. G.

Milk Production and Control. By W. C. Harvey and Harry Hill. H. K. Lewis & Co. Ltd., London, 1936, 655 pp., illus. Price, \$10.50.

This book is a welcome addition to dairy literature. As the title indicates, special attention is given to the different phases of production and control of milk. Although the book was specially written for present conditions in England, much can be learned from its chapters to help those directly connected with the production and distribution of milk and its supervision in any country.

The first chapter deals with the composition of milk and its food value and rightly serves as an introduction to the entire subject herein treated. The second chapter, Milk and Disease, discusses briefly the various diseases transmitted to man in milk. The authors mention several outbreaks to emphasize the importance of milk in its relation to human health. The chapters on the cow and the cow shed discuss briefly the proper care and housing of milk cows. Dairy equipment, actual milk production, and proper distribution are also discussed, with appropriate illustrations, in separate chapters.

A long chapter is devoted to the treatment of milk by heat. Here the different processes of pasteurization of milk and the problems connected with each process are discussed. Stassanization, sterilization, and irradiation of milk are also mentioned in this chapter. Another long chapter, devoted to laboratory and other control, is a good guide for students, health inspectors, and laboratory technicians connected with the inspection of milk.

In the chapters on designated milk and legislative control, the reader can easily follow the development of the dairy industry in England.

Milk Production and Control is not only a good guide or reference book for people concerned with the production and distribution of milk and government officials connected with milk inspection, for whom the authors have written this work, but will also serve as a suitable textbook for classrooms.—S. Y. R.

Diabetic Manual for Patients, By H. J. John. Second Edition. The C. V. Mosby Company, St. Louis, 1934. 232 pp. Price, §2.

In this little book the author tries "to present clearly and briefly what the person with diabetes should know about the disease and its treatment in order that he may more fully and therefore more successfully cooperate with his physician." With this purpose in view the author explains the underlying laws and principles, the conscious or unconscious violation of which in some way or other produces the disease. He describes how it is acquired and the changes that take place in the body during the illness.

Since food plays an important rôle in the medical improvement of the patient, a good portion of this book is devoted to diet planned according to the modern trend of giving food more rich in carbohydrates. Thus the food values of different food products are given, the appendices being fully devoted to this purpose. The author also stresses the efficacy and necessity of insulin treatment, and unlike many physicians, encourages its use.

---I. F.

Who Shall Survive; a New Approach to the Problem of Human Interrelations. By J. L. Moreno. Washington, D. C., Nervous and Mental Disease Publishing Co., 1934. 437 pp., diagra. Price, \$4.

Who Shall Survive deals with the study of the emotional relations among individuals who are functioning as a social group, or the cross-currents of emotion as they play back and forth between individuals. The material and illustrations are drawn from institutions and schools. The author develops a technic for a process of classification calculated to bring individuals together who are capable of harmonious interpersonal relationships, and creates a social group which can function at the maximum efficiency and with the minimum of disruptive tendencies and processes. He has rediscovered many homely truths by a different method which permits of their development to a more highly differentiated degree and also their utilization for the benefit of the individual. He differs from the psychoanalytic

approach in a significant way. While the analyst works backward to an explanation for the individual's conduct, he takes the individual's conduct as the starting point and works forward. All his various points of view, methods, and technic are of great significance. This is a good reference book on social problems.

—R. E. G.

The Student's Manual of Microscopic Technique; with Instructions for Photomicrography. By J. C. Tobias. American Photographic Publishing Co., Boston, Mass., 1936. 210 pp., illus. Price, \$2.50.

This is a useful guide for students of anatomy and biology. It contains (a) a good chapter on the microscope, its care, uses, and the physical rationale of its operation, including the polarizing microscope; (b) another excellent chapter on the microscopic objects found in water and the modes of their examination; (c) several chapters on the commoner methods of preparing tissues for microscopic examination, including the principal procedures of sectioning, staining, etc., and their examinations microscopically in the fresh state and as permanent preparations; and (d) a special section on microphotography. Most of the principal topics are illustrated with excellent text figures.

The author has happily combined in one compact and convenient volume the principal methods of microscopic technic usually found in such standard works as Gage's, Lee's, Mallory and Wright's, and others. The book should have general acceptance as an excellent complement to ordinary textbooks of histology and pathology.—A. G.

Mountains and Earthquakes. By Harold Jeffreys. Methuen & Co. Ltd., London, 1935. 183 pp. Price, \$2.

This book gives a comprehensive discussion of the latest developments in the study of the earth from the view points of the physicist, the geologist, and the geodesist. The presentation is well planned, and the language, though precise, is simple. The subject is probably too for advanced for the comprehension of the layman, but it is very interesting to the technical man who has a good working knowledge of mathematics, physics, and geology.—Q. A. A.

The Mental Health Emphasis in Education—A Qualitative Study. By H. C. Patey and G. S. Stevenson. The National Committee for Mental Hygiene, Inc., New York. 96 pp.

This treatise has for its working principle the idea that "basically the philosophy of mental hygiene and education are identical and may be stated in terms of complete living or satisfac-

tory functioning of the human organism." In terms of this principle it asserts that "at the present time the relationships of mental hygiene and education are confused by the fact that mental hygienists have given much of their attention to corrective therapy while educationalists have been concerned with fostering normal development without insight gained from observations of exaggerated functioning," and makes an effort to indicate methods of coordinating, articulating, and integrating the other agencies of society; namely, industry, business, law, social service, journalism, art, theology, and medicine, with education, in order for the latter "to realize all of the opportunities that lie within the scope of its own organization and objective." Perhaps too confident and optimistic, the authors claim that "the professional mental hygienist brings to each situation and interpretation intensive experience with the problems of individuals, with the purpose of bringing objectives to a focus in terms of what is most satisfying."—A. V. C.

Elementary Microtechnique. By H. Alan Peacock. Edward Arnold & Co., London, 1935. 200 pp. Price, \$1.50.

This is an unassuming little book, which contains much useful information on microtechnic. It is intended primarily for beginners in histology and cytology, although advanced students equally will find the work a good reference book.

The book is introduced with a short summary of the structure of the cell and protoplasm, followed by brief descriptions of the processes of microtechnic. Chapters III and IV cover outlining methods and technic. There is an alphabetical list of special subjects with the various methods to be followed and their preparation in Chapter V; of stains and their uses in Chapter VI; and of formulæ and hints in Chapter VII. Three appendices are included, the last being a bibliography.—M. T.

Sex Practice in Marriage. By C. B. S. Evans. Second Edition. Emerson Books, Inc., New York, 1935. 128 pp. Price, \$1.95.

This is a clear and simple exposition of a subject of vital interest to married couples and young people contemplating marriage who are seeking happiness. The book, which is so easy to read that it will but take few hours to finish, will not only help bring about a better understanding between husband and wife but also make for a better appreciation of each other's needs and problems. In serving as a guide in securing a happy mating, this book will help married people in solving their marrital problems arising from ignorance of the proper functions

of sex, which will be conducive to harmony in the home, lessen friction, and minimize divorce. Likewise physicians will find the book a great help to their own method of handling related problems.—U. D. M.

Engineer-Custodians Manual. By Thomas J. Brett. American Technical Society, Chicago, 1924. 192 pp. \$2.50.

This is a useful book for building superintendents, engineers, custodians, firemen, electricians, and others interested in the operation and maintenance of public buildings. It embodies valuable information that is usually required for passing competitive civil-service examinations; contains over 500 questions and answers on boilers, combustion engines, heating and ventilating, air-conditioning, pumps, sanitation, plumbing, electrical machinery, and mechanics; over 200 engineering formulas and tables, and general information. The book is fully indexed.

—R. M.

Diesel and other Internal-Combustion Engines. By Howard E. Degler. American Technical Society, Chicago, 1936. 237 pp. Price, \$2.50.

This is practical text on the development, principles of operation, construction, details, and performance of stationary and portable diesel, gas, and gasoline engines.

In Part I the development and application, types, characteristics, efficiency, advantages, thermodynamics, and comparison of internal-combustion engines are set forth. Part II classifies fuels and fuel-air mixtures, gas producers, and liquid fuels and gives fuel-burning characteristics. Part III contains valuable information on automobile and aëroplane gas and gasoline engines. Part IV treats of low-pressure and moderate-pressure oit engines. Part V is devoted to heavy-duty diesel engines of various types. Part VI takes up high-speed diesel engines, their development and application. In Parts VII, VIII, IX, and X is found valuable information on diesel fuel-injection requirements and methods, engine parts, testing and testing methods, and economics of diesel power, respectively.—R. M.

Carpentry, By Gilbert Townsend. American Technical Society, Chicago, 1936. 436 pp. Price, \$2.

This book is a practical treatise on simple building construction, including framing, roof construction, general carpentry work, exterior and interior fluish of buildings, building forms, and working drawings.

The book is adapted for use as a text in vocational, trade, high, and technical schools. It is an excellent text for home

study and reference for carpenters, apprentices, home owners, and anyone interested in building construction work.—R. M.

Air Conditioning and Engineering. By Engineering Staff of American Blower Corporation and Canadian Sirocco Co., Ltd. American Blower Corporation, Detroit, 1935. 691 pp. Price, \$5.

This is a treatise on the technic of conditioning and mechanical movement of air for the health and comfort of human beings and the efficiency of production in industry. It is a ready reference containing valuable data on air conditioning and engineering, including fundamental principles, laws, tables, sample calculations, and information relating to dimensions and capacities. In the apparatus and equipment section are found dimension and capacity tables and types of equipment used in actual practice. It is an excellent book for air-conditioning engineers.

-R. M.

A Guide to Sexing Chicks. By Charles S. Gibbs. Orange Judd Publishing Co., Inc., New York, 1935. 63 pp. Price, \$1.25.

The author is a research professor of veterinary science at the Massachusetts State College at Amherst. In his Guide to Sexing Chicks he describes the art which was first brought to light by Kiyoshi Masui and Juro Hashimoto of Tokyo Imperial University, and later put into practical application by Kojima and Sakagiyma. He mentions two schools of chick sexing, one depending upon the presence or absence of processes in the vent, and the other on the wrinkles of the mucuous membrane of the cloaca.

Sexing chicks, as an art, requires skill, clear vision, rapid eye accommodation and ability to withstand bright light, steady hands, and nimble fingers. To the novice patient practice and mastery of its technic are necessary to attain a satisfactory degree of proficiency. The detailed description of the steps to be undertaken given in this book will be of practical value to him and other beginners.

The author suggests that sexing be done in bright day light or with the use of a 200-watt electric bulb, either blue or with frosted tip. The best time to sex is twelve hours after hatching or as soon as the chick has dried. A large process in the vent identifies a cockerel, and no process or a small one, a female. In actual identification a group of 5 per cent is confusing and may turn out one way or the other.—C. X. B.

The Medical Cookery Book. By Borothy Sewart. J. Wright and Sons, Ltd., London, 1935. 136 pp. Price, \$1.25.

159

In the convalescent stage of many diseases in which drugs usually play an insignificant part, nourishment is more vitally important to the patient, since a suitable diet is more conducive to recovery. At this stage the consideration of proper foods becomes the concern of those whose responsibility it is to prescribe diet. The 300 recipes compiled in this book for making soup, salads, and other ideal foods for convalescents will provide the solutions to most of the problems concerning the right foods to give. The recipes have been thoroughly tested and are simple and economical. The book also contains much information on how the foods should be served, which suggestions increase its practical value.—A. J. H.

International Trade; Principles and Practices. By Paul V. Horn, Prentice-Hall, Inc., New York, 1935, 723 pp. Price, \$5.

A comprehensive treatise on its subject, this book not only deals with the principles and practices of foreign trade, but also treats of its historical background and its legal aspects. Intended primarily as a textbook for use in colleges and universities, the book will be found useful by students and by those who are actually engaged in international trade. A lot of valuable information is given which the latter, especially, could use to advantage to broaden their knowledge of the aspects of oversea trade as a profession. The subject is discussed as a business calling, and also as an instrument of governments in their international relations with one another.

Chapters 5 and 6 deal with a graphical survey of international trade. Chapters 10 and 11 give a history of tariffs in general and of United States tariff in particular, and trace the evolution of international commercial policies from antiquity to the present. Thoroughly discussed in Chapters 17 and 18 are the subjects of foreign investments, foreign exchange, and the financing of foreign trade. The practical modus operandi of foreign business trade is likewise fully treated, just as the technic of foreign-trade promotion and advertising and the collection of foreign credits are ably presented.

Adding much to the usefulness of the book are the review questions, problems, and suggested references at the end of each chapter.

A typographical error in the chart on page 154 (Organization of the United States Customs) is evident, the territories under

the jurisdiction of the Secretaries of War and Navy having been interchanged.—A. de C.

Lancashire Sea-Fisheries Laboratory. James Johnstone Memorial Volume. University Press of Liverpool, 1934. 348 pp. Price, 21s.

The latest tendency in the cultured world in the way of bonoring a scholar is the publication of a memorial volume giving evidences of the world's appreciation of his work. For this purpose the present volume was prepared to commemorate the death of James Johnstone and his retirement from the chair of Oceanography at Liverpool in 1935. It is a symposium on various matters dealing with the sea, including its physical and biological phenomena. It includes original investigations on varied oceanographic topics, written by men identified with various well-known schools of thought, both of Europe and America. The articles are independent from one another, and the only coordination among them is that they reflect the world to which Johnstone dedicated himself. In each article much useful information will be found by the oceanographer, the embryologist, the geologist, the ecologist, the parasitologist, and the physical chemist.—H. A. R.

Researches on Vitamins, 1900-1911. By Prof. Dr. G. Grijns. J. Noorduyn en Zoon N. V., Gorinchem, 1985. 254 pp.

This book was prepared to give evidence of the admiration and gratitude which the world owes Dr. G. Grijns for his valuable contributions to the science of vitamins. It is a compilation of his early works covering his investigations on polyneuritis gallinarum, with which is included his thesis on "the physiology of the nervous opticus," translated into German, and which was published while he was still a student at the University of Utrecht.

Doctor Grijns is largely to be remembered for his classical researches on heriberi. With his predecessor Erijkman, a fellow Dutchman, he is acknowledged as one of the founders of vitamin science. Considering the consequences of his investigation and the benefits which mankind reaped from them, Grijns deserves more of the world's gratitude than can be expressed by the preparation of this memorial volume.

The book, however, is more than a commemorative volume. In making the classical studies of the author accessible in English translation, the book commends itself to a large circle of readers, especially those who are making a historical study of vitamin science.—A. J. H.
